(54) Title: SUNFLOWER ANTI-PATHOGENIC PROTEINS AND GENES AND THEIR USES

(57) Abstract: Compositions and methods to aid in protecting plants from invading pathogenic organisms are provided. The compositions of the invention comprise anti-pathogenic genes, including 5' regulatory sequences in the promoter, and proteins encoded by the anti-pathogenic genes. The compositions find use in methods for reducing or eliminating damage to plants caused by plant pathogens. Transformed plants, plant cells, tissues, and seed having enhanced disease resistance are also provided.

VO 00/78983 A2

SUNFLOWER ANTI-PATHOGENIC PROTEINS AND GENES AND THEIR USES

FIELD OF THE INVENTION

The invention relates to nucleotide sequences and proteins for antipathogenic agents and their uses, particularly the genetic manipulation of plant with genes that enhance disease resistance. Promoter sequences are also provided.

5

10

15

20

25

BACKGROUND OF THE INVENTION

Plant diseases are often a serious limitation on agricultural productivity and have therefore influenced the history and development of agricultural practices.

Only recently have Mendelian genes controlling disease resistance been isolated, and elucidation of their biochemical functions remains a major challenge.

Plant disease outbreaks have resulted in catastrophic crop failures that have triggered famines and caused major social change. Generally, the best strategy for plant disease control is to use resistant cultivars selected or developed by plant breeders for this purpose. However, the potential for serious crop disease epidemics persists today, as evidenced by outbreaks of the Victoria blight of oats and southern corn leaf blight.

Mendelian genetics of resistance to disease in plants is well known.

Resistance is often controlled by a single gene, either dominant, semidominant, or recessive. In some instances, multigenes are involved. However, the biochemical mechanisms for gene products involved in plant resistance are known in only a few model cases.

Among the causal agents of infectious diseases of crop plants, phytopathogenic fungi play the dominant role not only by causing devastating epidemics, but also through the less spectacular although persistent and significant annual crop yield losses that have made fungal pathogens a serious economic factor. All of the species of flowering plants are attacked by pathogenic fungi. Generally, however, a single plant species can be host to only a few fungal species, and similarly, most fungi have a limited host range.

To colonize plants, fungal microorganisms have evolved strategies to invade plant tissue, to optimize growth in the plant, and to propagate. Bacteria and viruses, as well as some opportunistic fungal parasites, often depend on natural openings or wounds for invasion. In contrast, many true phytopathogenic fungi have evolved mechanisms to actively traverse the plant's outer structural barriers, the cuticle and the epidermal cell wall. To gain entrance, fungi generally secrete a cocktail of hydrolytic enzymes.

Despite the large number of microorganisms capable of causing disease, most plants are resistant to any given pathogen. The defense mechanisms utilized by plants can take many different forms, ranging from passive mechanical or preformed chemical barriers, which provide non-specific protection against a wide range of organisms, to move more active host-specific responses that provide host-or varietal-specific resistance. Resistance (R) genes are effective against individual pathogen varieties. These genes have been employed in breeding programs upon discovery.

10

15

20

25

30

A hypersensitive response (HR) that is elaborated in response to invasion by all classes of pathogens is the most common feature associated with active host resistance. In most cases, activation of the HR leads to the death of cells at the infection site, which results in the restriction of the pathogen to small areas immediately surrounding the initially infected cells. At the whole plant level, the HR is manifested as small necrotic lesions. The number of cells affected by the HR is only a small fraction of the total in the plant, so this response obviously contributes to the survival of plants undergoing pathogen attack.

In plants, robust defense responses to invading phytopathogens often conform to a gene-for-gene relationship. Resistance to a pathogen is only observed when the pathogen carries a specific avirulence (avr) gene and the plant carries a corresponding resistance (R) gene. Because avr-R gene-for-gene relationships are observed in many plant-pathogens systems and are accompanied by a characteristic set of defense responses, a common molecular mechanism avr-R gene mediated resistance has been postulated. Thus, disease resistance results from the expression of a resistance gene in the plant and a corresponding avirulence gene in the pathogen and is often associated with the rapid, localized cell death of the hypersensitive response. R genes that respond to specific bacteria, fungal, or viral

pathogens have been isolated from a variety of plant species and several appear to encode cytoplasmic proteins. It has been unclear how such proteins could recognize an extracellular pathogen. Many strategies for plant disease control have been attempted. Resistant cultivars has been selected or developed by plant breeders for disease control. Resistance is especially important for major crops such as the cereals, sugar cane, potato, and soybean. The limitation in use of disease resistance in modern agriculture is adaptability by pathogens to overcome resistance.

5

10

15

20

25

30

The development of new strategies to control diseases is the primary purpose of research on plant/pathogen interactions. These include, for example, the identification of essential pathogen virulence factors and the development of means to block them, or the transfer of resistance genes into crop plants from unrelated species. An additional benefit is a better understanding of the physiology of the healthy plant through a study of the metabolic disturbances caused by plant pathogens.

SUMMARY OF THE INVENTION

Anti-pathogenic compositions and methods for their use are provided. The compositions comprise anti-pathogenic proteins and their corresponding genes and regulatory regions. Particularly, sunflower PR5-1, defensin, and berberine bridge enzyme (BBE) homologues, and fragments and variants thereof, are provided.

The compositions are useful in protecting a plant from invading pathogenic organisms. One method involves stably transforming a plant with a nucleotide sequence of the invention to engineer broad spectrum disease resistance in the plant. The nucleotide sequences will be expressed from a promoter capable of driving expression of a gene in a plant cell. A second method involves controlling plant pathogens by applying an effective amount of an anti-pathogenic protein or composition of the invention to the environment of the pathogens. Additionally, the nucleotide sequences of the invention are useful as genetic markers in disease resistance breeding programs.

Promoters of the genes of the invention find use as disease or pathogeninducible promoters. Such promoters may be used to express other coding regions,

particularly other anti-pathogenic genes, including disease and insect resistance genes.

The compositions of the invention additionally find use in agricultural and pharmaceutical compositions as antifungal and antimicrobial agents. For agricultural purposes, the compositions may be used in sprays for control of plant disease. As pharmaceutical compositions, the agents are useful for antibacterial and antimicrobial treatments.

The methods of the invention find use in controlling pests, including fungal pathogens, viruses, nematodes, insects, and the like. Transformed plants, plant cells, plant tissues, and seeds, as well as methods for making such transformed compositions are additionally provided.

10

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 depicts the cDNA cloning strategy. (I) Sunflower cDNA libraries

were directionally constructed into pBluescript phagemid using a ZAP-cDNA synthesis kit from Stratagene; (II) oligonucleotide primers (P1 and P3) were used to amplify the 5' end of a target gene by a rapid amplification of cDNA ends (RACE) method. PCR and the 3' end of the gene were amplified with P2 and P4 primers; (III) P5 primer was designed at the putative start codon (ATG) or upstream the start codon in order to clone full-length cDNA; (IV) the full-length cDNA of the target gene were amplified by PCR with P5 and P4 primers; and (V) the expected full-length cDNA was inserted into TA vector (Invitrogen) for sequencing. Shaded areas represent cloned regions.

Figure 2 depicts an alignment of the amino acid sequence of PR5-1 (SEQ ID:13) from sunflower with other PR5 or osmatin-like proteins from grape, (Swiss-Prot Accession Nos. P93621, SEQ ID:10; and O04708, SEQ ID:11); soybean, (Swiss-Prot Accession No. P25096, SEQ ID:12); tomato, (Swiss-Prot Accession No. Q01591, SEQ ID:14); and potato, (Swiss-Prot Accession No. P50701, SEQ ID:15). A star indicates that the amino acid at that position is conserved for all aligned sequences, and a dash denotes gaps in alignment.

Figure 3 depicts an alignment of the amino acid sequence of a BBE (SEQ ID:20) from sunflower with other BBE homologues and two possible sunflower carbohydrate oxidases. Sunflower-15 (SEQ ID:17) and -19 (SEQ ID:16)

sequences were reported in WO 98/13478. Other BBE homologues include a reticuline oxidase precursor from California poppy, (Swiss-Prot Accession No. P30986, SEQ ID:19) and a BBE from opium poppy, (Swiss-Prot Accession No. P93479, SEQ ID:18).

Figure 4 depicts an alignment of the amino acid sequence of a sunflower defensin (SEQ ID:24) with other antifungal defensins from garden pea (Swiss-Prot Accession No. Q01784, SEQ ID:25), white mustard (Swiss-Prot Accession No. P30231, SEQ ID:22), radish (Swiss-Prot Accession No. P30230, SEQ ID:21) and *Arabidopsis* (Swiss-Prot Accession No. P30224, SEQ ID:23).

5

DETAILED DESCRIPTION OF THE INVENTION

Compositions and methods for controlling pathogenic agents are provided. The anti-pathogenic compositions comprise sunflower genes, including their promoters, and proteins. Particularly, the sunflower genes and proteins are selected from PR5-1, defensin, and berberine bridge enzyme (BBE). Accordingly, the methods are also useful in protecting plants against fungal pathogens, viruses, nematodes, insects and the like. Additionally, the compositions can be used in formulation use for their antimicrobial activities.

Additionally, the present invention provides for isolated nucleic acid molecules comprising nucleotide sequences for plant promoters shown in SEQ ID:7, SEQ ID:8, and SEQ ID:9; for nucleotide sequences encoding the amino acid sequences shown in SEQ ID:1, SEQ ID:2, and SEQ ID:3; the nucleic acid molecules deposited in a bacterial host as Patent Deposit Nos. PTA-67, PTA-73, PTA-75, respectively; and the nucleic acid molecule deposited as Patent Deposit No. PTA-560 which comprises the nucleotide sequence shown in SEQ ID:9. Further provided are polypeptides having an amino acid sequence encoded by a nucleic acid molecule described herein, for example those set forth in SEQ ID:4. SEQ ID:5, and SEQ ID:6 those deposited as Patent Deposit Nos. PTA-67, PTA-73, PTA-75, respectively, and fragments and variants thereof.

Plasmids containing the promoter sequences and gene nucleotide sequences of the invention were deposited with the Patent Depository of the American Type Culture Collection, Manassas, Virginia. The following plasmids were deposited:

May 13, 1999, pHp 15383 containing BBE cDNA; May 13, 1999, pHp 15384

containing BBE promoter sequence; May 13, 1999, pHp 15385 containing defensin cDNA; August 31, 1999, pHp 16125 containing defensin promoter sequence; May 13, 1999, pHp 15395 containing PR5-1 promoter sequences; and May 14, 1999, pHp 15393 containing PR5-1 cDNA; and assigned Patent Deposit Nos. PTA-73, PTA-74, PTA-75, PTA-560, PTA-76, PTA-67, respectively. These deposits will be maintained under the terms of the Budapest Treaty on the International Recognition of the Deposit of Microorganisms for the Purposes of Patent Procedure. These deposits were made merely as a convenience for those of skill in the 2rt and are not an admission that a deposit is required under 35 U.S.C. §112.

As indicated, the sequences of the invention find use as antifungal agents. Thus, the genes can be used to engineer plants for broad spectrum disease resistance. In this manner, the sequences can be used alone or in combination with each other and/or with other known disease resistance genes.

Additionally, the sequences can be used as markers in studying defense signal pathways and in disease resistance breeding programs. The sequences can also be used as baits to isolate other signaling components in defense/resistance responsiveness and to isolate the corresponding promoter. See, generally, Sambrook et al. (1989) Molecular Cloning: A Laboratory Manual (2d ed.), Cold Spring Harbor Laboratory Press, Plainview, New York.

15

20

25

30

The invention encompasses isolated or substantially purified nucleic acid or protein compositions. An "isolated" or "purified" nucleic acid molecule or protein, or biologically active portion thereof, is substantially free of other cellular material, or culture medium when produced by recombinant techniques, or substantially free of chemical precursors or other chemicals when chemically synthesized.

Preferably, an "isolated" nucleic acid is free of sequences that naturally flank the nucleic acid (i.e., sequences located at the 5' and 3' ends of the nucleic acid) in the genomic DNA of the organism from which the nucleic acid is derived. For example, in various embodiments, the isolated nucleic acid molecule can contain less than about 5 kb, 4 kb, 3 kb, 2 kb, 1 kb, 0.5 kb, or 0.1 kb of nucleotide sequences that naturally flank the nucleic acid molecule in genomic DNA of the cell from which the nucleic acid is derived. A protein that is substantially free of cellular material includes preparations of protein having less than about 30%, 20%,

10%, 5%, (by dry weight) of contaminating protein. When the protein of the invention or biologically active portion thereof is recombinantly produced, preferably, culture medium represents less than about 30%, 20%, 10%, or 5% (by dry weight) of chemical precursors or non-protein of interest chemicals.

By "anti-pathogenic compositions" is intended that the compositions of the invention are capable of suppressing, controlling, and/or killing the invading pathogenic organism.

5

10

15

20

25

30

By "disease resistance" is intended that the plants avoid the disease symptoms that are the outcome of plant-pathogen interactions. That is, pathogens are prevented from causing plant diseases and the associated disease symptoms. The methods of the invention can be utilized to protect plants from disease, particularly those diseases that are caused by plant pathogens.

The compositions of the invention include isolated nucleic acid molecules comprising the promoter nucleotide sequences set forth in SEQ ID:7, SEQ ID:8 and SEQ ID:9. By "promoter" is intended a regulatory region of DNA usually comprising a TATA box capable of directing RNA polymerase II to initiate RNA synthesis at the appropriate transcription initiation site for a particular coding sequence. A promoter may additionally comprise other recognition sequences generally positioned upstream or 5' to the TATA box, referred to as upstream promoter elements, which influence the transcription initiation rate. It is recognized that having identified the nucleotide sequences for the promoter regions disclosed herein, it is within the state of the art to isolate and identify further regulatory elements in the 5' untranslated region upstream from the particular promoter regions identified herein. Thus, for example, the promoter regions disclosed herein may further comprise upstream regulatory elements that confer tissue-preferred expression of any heterologous nucleotide sequence operably linked to one of the disclosed promoter sequences. See particularly Australian Patent No. AU-A-77751/94 and U.S. Patent Nos. 5,466,785 and 5,635,618. Generally with the promoter sequences of the invention, the pattern of expression will be inducible.

The inducible promoter sequences of the present invention, when assembled within a DNA construct such that the promoter is operably linked to a nucleotide sequence of interest, enable expression of the nucleotide sequences in

the cells of a plant stably transformed with this DNA construct. The nucleotide sequence of interest encompasses both homologous and heterologous sequences. By "heterologous nucleotide sequence" is intended a sequence that is not naturally occurring with the promoter sequence. While this nucleotide sequence is heterologous to the promoter sequence, it may be homologous, or native, or heterologous, or foreign, to the plant host. Choice of the promoter sequence will determine when and where within the organism the heterologous nucleotide sequence is expressed. Where gene expression in response to a stimulus is desired, an inducible promoter of the invention is the regulatory element of choice. When using an inducible promoter, expression of the nucleotide sequence is initiated in cells in response to a stimulus. By "stimulus" is intended a chemical, which may be applied externally or may accumulate in response to another external stimulus; a pathogen, which may, for example, induce expression as a result of invading a plant cell; or other factor such as environmental stresses, including but not limited to, drought, temperature, and salinity.

10

15

20

25

30

Compositions of the invention also include the nucleotide sequences for three sunflower genes: a sunflower PR5 homologue as set forth in SEQ ID:4; a sunflower defensin homologue as set forth in SEQ ID:6; and, a sunflower BBE homologue as set forth in SEQ ID:5, and the corresponding amino acid sequences for the proteins encoded thereby as set forth in SEQ ID:1, SEQ ID:3 and SEQ ID:2, respectively. These gene sequences may be assembled into a DNA construct such that the gene is operably linked to a promoter that drives expression of a coding sequence in a plant cell. Plants stably transformed with this DNA construct express, either in a constitutive or inducible manner, a protein of the invention. Expression of this protein creates or enhances disease resistance in the transformed plant.

BBE [9S0-reticuline:oxygen oxidoreductase (methylene-bridge-forming), EC 1.5.3.9] is a covalently flavinylated oxidase that is a key enzyme in benzophenanthridine alkaloid biosynthesis in plants (Kutchan et al. (1995) J. Biol. Chem. 270:24475-24481; Blechert et al. (1995) Proc. Natl. Acad. Sci. USA 92:4099-4105; Dittrich et al. (1991) Proc. Natl. Acad. Sci. USA 88:9969-9973; Chou et al. (1998) Plant J. 15:289-300). Members of the alkaloid family are known to have potent pharmacological activities. Berberine, for example, is

currently used as an antibacterial treatment for eye infections in Europe and for intestinal infections in the far East. The benzophenanthridine alkaloid, sanguimarine, is an antimicrobial used in the treatment of peridontal disease in both the United States and Europe (Kutchan et al. (1995) J. Biol. Chem.

270:24475-24481). In addition, BBE has anti-Phytophthora and anti-Pythium activity, as well as carbohydrate oxidase activity (WO 98/13478). The BBE-transgenic plants of the invention have enhanced resistance to pathogens. BBE and several other enzymes in the defense pathway are induced by elicitors. See for example Blechert et al. (1995) Proc. Natl. Acad. Sci. USA 92:4099-4105; Dittrich et al. (1991) Proc. Natl. Acad. Sci. USA 88:9969-9973.

10

15

20

25

30

A sunflower BBE is disclosed that is regulated by oxalate oxidase (oxox) expression and *Sclerotinia* infection. The cDNA (SEQ ID:5) and promoter (SEQ ID:8) sequences of sunflower BBE are provided. In addition, expression of this BBE in sunflower was up-regulated by oxalic acid, H₂O₂, salicylic acid (SA) and jasmonic acid (JA).

Pathogenesis-related protein-5 (PR5) is one of the 9 classes of PR proteins. PR5 shares sequence similarity with osmotin, thaumatin, and zeamatin proteins (Hu et al. (1997) Plant Mol. Biol. 34:949-959; Ryals et al. (1996) Plant Cell 8:1809-1819). PR5 proteins have been characterized from a wide range of plant species in both dicotyledonous and monocotyledonous plants. Although the biological function of PR5 proteins has yet to be established, members of this group have been shown to have antifungal activities against a broad range of fungal pathogens (Hu et al. (1997) Plant Mol. Biol. 34:949-959; Ryals et al. (1996) Plant Cell 8:1809-1819); Liu et al. (1994) Proc. Natl. Acad. Sci. USA 91:1888-1892; Liu et al. (1995) Plant Mol. Biol. 29:1015-1026; Zhu et al. (1995) Plant Physiol. 108:929-937). In Arabidospsis. the induction of PR5 is SA-dependent. The sunflower PR5-1 gene disclosed herein was regulated by oxox expression and Sclerotinia-infection. The sunflower PR5-1 promoter contains potential pathogenresponsive cis-elements, such as an MRE (MYB recognition element).

Defensins are one class among the numerous types of Cys-rich antimicrobial polypeptides, which differ in length, number of cysteine bonds, or folding pattern (Bornann, H.G. (1995) Annu. Rev. Immunol. 13:61-92). Like cecropins, insect defensins are produced in a pathogen-inducible manner by the

insect fat body and secreted in the hemolymph (Huffmann et al. (1992) Immunol. Today 13:411-415). Mammalian defensins are produced by various specialized cells in the mammalian body (Lehrer et al. (1993) Annu. Rev. Immunol. 11:105-128; Ganz et al. (1994) Curr. Opin. Immunol. 6:584-589). The structural and functional properties of plant defensins resemble those of insect and mammalian defensins (Terras et al. (1995) Plant Cell 7:573-588; Broekaer et al. (1995) Plant Physiol. 108:1353-1358). Plant defensins inhibit the growth of a broad range of fungi at micromolar concentrations by inhibiting hyphal elongation or inhibiting hyphal extension (Broekaer et al. (1995) Plant Physiol. 108:1353-1358).

10

15

20

25

30

Plant defensins are important components of the defense system in plants. They are located at the periphery of different organs and are induced by pathogens. A sunflower cDNA was isolated that encodes a defensin peptide (SEQ ID:6). This defensin gene was up regulated by Sclerotinia infection, oxox expression, oxalic acid, H₂O₂ and SA as well as jasmonic acid. In general, plant defensin genes such as Arabidopsis PDF1.2 and a radish defensin are induced by pathogens via an SA-independent and JA-dependent pathway (Thomma et al.) Proc. Natl. Acad. Sci. USA 95:15107-15111; Terras et al. (1995) Plant Cell 7:573-588; Terra et al. (1988) Plante 206:117-124). The sunflower defensin gene appears to be the only defensin that is regulated via a SA-dependent pathway. The sunflower defensin promoter contains potential pathogen responsive cis-elements, such as W-boxes and G-boxes.

The proteins of the invention may be altered in various ways including amino acid substitutions, deletions, truncations, and insertions. Methods for such manipulations are generally known in the art. For example, amino acid sequence variants of the proteins can be prepared by mutations in the DNA. Methods for mutagenesis and nucleotide sequence alterations are well-known in the art. See, for example, Kunkel, T. (1985) Proc. Natl. Acad. Sci. USA 82:488-492; Kunkel et al. (1987) Methods in Enzymol. 154:367-382; U.S. Patent No. 4,873,192; Walker et al. (1983) (eds.) Techniques in Molecular Biology, MacMillan Publishing Company, NY and the references cited therein. Thus, the genes and nucleotide sequences of the invention include both the naturally occurring sequences as well as mutant forms. Likewise, the proteins of the invention encompass both naturally occurring proteins as well as variations and modified forms thereof. Such variants

will continue to possess the desired defense activation activity. Obviously, the mutations that will be made in the DNA encoding the variant must not place the sequence out of reading frame and preferably will not create complementary regions that could produce secondary mRNA structure. See, for example, EP Patent Application Publication No. 75,444.

5

10

15

20

25

30

Fragments and variants of these native nucleotide and amino acid sequences are also encompassed by the present invention. By "fragment" is intended a portion of the nucleotide or amino acid sequence. Fragments of a promoter nucleotide sequence may retain their regulatory activity. Thus, for example, less than the entire promoter sequences disclosed herein may be utilized to drive expression of an operably linked nucleotide sequence of interest, such as a nucleotide sequence encoding a heterologous protein. It is within skill in the art to determine whether such fragments decrease expression levels or alter the nature of expression, i.e., and constitutive or inducible expression. Alternatively, fragments of a promoter nucleotide sequence that are useful as hybridization probes, such as described below, generally do not retain this regulatory activity.

Nucleic acid molecules that are fragments of a promoter nucleotide sequence comprise at least 15, 20, 25, 30, 35, 40, 45, 50, 75, 100, 325, 350, 375, 400, 425, 450, or 500 nucleotides, or up to the number of nucleotides present in the full-length promoter nucleotide sequence set forth in SEQ ID: 7, 8, and 9. Fragments of a promoter sequence that retain their regulatory activity comprise at least 30, 35, 40 contiguous nucleotides, preferably at least 50 contiguous nucleotides, more preferably at least 75 contiguous nucleotides, still more preferably at least 100 contiguous nucleotides of the particular promoter nucleotide sequence disclosed herein. Preferred fragment lengths depend upon the objective and will also vary depending upon the particular promoter sequence.

The nucleotides of such fragments will usually comprise the TATA recognition sequence of the particular promoter sequence. Such fragments may be obtained by use of restriction enzymes to cleave the naturally occurring promoter nucleotide sequence disclosed herein; by synthesizing a nucleotide sequence from the naturally occurring sequence of the promoter DNA sequence; or may be obtained through the use of PCR technology. See particularly, Mullis et al. (1987) Methods Enzymal. 155:335-350, and Erlich, ed. (1989) PCR Technology (Stockton

Press, New York). Variants of these promoter fragments, such as those resulting from site-directed mutagenesis, are also encompassed by the compositions of the present invention.

With respect to the antipathogenic nucleotide sequences, fragments of a nucleotide sequence may encode protein fragments that retain the biological activity of the native proteins, i.e., the sequences set forth in SEQ IDS 1,2, and 3, and hence enhance disease resistance when expressed in a plant. Alternatively, fragments of a coding nucleotide sequence that is useful as hybridization probes generally do not encode fragment proteins retaining biological activity. Thus, fragments of a nucleotide sequence may range from at least about 20 nucleotides, about 50 nucleotides, about 100 nucleotides, and up to the entire nucleotide sequence encoding the proteins of the invention.

5

10

15

20

25

30

A fragment of an antipathogenic nucleotide sequence that encodes a biologically active portion of a protein of the invention will encode at least 15, 25, 30, 40, 50, 75, 100, or 150 contiguous amino acids, or up to the total number of amino acids present in a full-length protein of the invention. Fragments of a nucleotide sequence of the invention that are useful as hybridization probes for PCR primers generally need not encode a biologically active portion of a protein.

A biologically active portion of a protein of the invention can be prepared by isolating a portion of one of the nucleotide sequences of the invention, expressing the encoded portion of the protein (e.g., by recombinant expression in vitro), and assessing the activity of the encoded portion of the protein of interest. Nucleic acid molecules that are fragments of a nucleotide sequence of the invention comprise at least 15, 20, 50, 75, 100, 325, 350, 375, 400, 425, 450, 500, 550, 600, 650, 700, or 800 nucleotides, or up to the number of nucleotides present in a full-length sunflower homologue nucleotide sequence disclosed herein.

By "variants" is intended substantially similar sequences. For nucleotide sequences, conservative variants include those sequences that, because of the degeneracy of the genetic code, encode the amino acid sequence of one of the antipathogenic polypeptides of the invention. Naturally occurring allelic variants such as these can be identified with the use of well-known molecular biology techniques, as, for example, with polymerase chain reaction (PCR) and hybridization techniques as outlined below. Variant nucleotide sequences also

include synthetically derived nucleotide sequences, such as those generated, for example, by using site-directed mutagenesis but which still encode an antipathogenic protein of the invention. Generally, variants of a particular nucleotide sequence of the invention will have at least 40%, 50%, 60%, 70%, generally at least 75%, 80%, 85%, 87%, preferably about 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, and more preferably about 98%, 99% or more sequence identity to that particular nucleotide sequence as determined by sequence alignment programs described elsewhere herein using default parameters.

5

10

15

20

25

30

By "variant" protein is intended a protein derived from the native protein by deletion (so-called truncation) or addition of one or more amino acids to the Nterminal and/or C-terminal end of the native protein; deletion or addition of one or more amino acids at one or more sites in the native protein; or substitution of one or more amino acids at one or more sites in the native protein. Variant proteins encompassed by the present invention are biologically active, that is they continue to possess the desired biological activity of the native protein, that is, the defense activation activity as described herein. Such variants may result from, for example, genetic polymorphism or from human manipulation. Biologically active variants of a native antipathogenic protein of the invention will have at least 40%, 50%, 60%, 70%, generally at least 75%, 80%, 85%, preferably about 90% to 95% or more, and more preferably about 98% or more sequence identity to the amino acid sequence for the native protein as determined by sequence alignment programs described elsewhere herein using default parameters. A biologically active variant of a protein of the invention may differ from that protein by as few as 1-15 amino acid residues, as few as 1-10, such as 6-10, as few as 5, as few as 4, 3, 2, or even 1 amino acid residue.

The proteins of the invention may be altered in various ways including amino acid substitutions, deletions, truncations, and insertions. Methods for such manipulations are generally known in the art. For example, amino acid sequence variants of the antipathogenic proteins can be prepared by mutations in the DNA. Methods for mutagenesis and nucleatide sequence alterations are well known in the art. See, for example, Kunkel (1985) Proc. Natl. Acad. Sci. USA 82:488-492; Kunkel et al. (1987) Methods in Enzymol. 154:367-382; US Patent No. 4,873,192;

Walker and Gaastra (eds.) *Techniques in Molecular Biology*, MacMillan Publishing Company, NY (1983) and the references cited therein.

5

10

15

20

25

30

Thus, the promoters and gene nucleotide sequences of the invention include both the naturally occurring sequences as well as mutant forms. Likewise, the proteins of the invention encompass both naturally occurring proteins as well as variations and modified forms thereof. Such variants will continue to possess the desired promoter activity or antipathogenic defense protein activity. Obviously, the mutations that will be made in the DNA encoding a variant protein must not place the sequence out of reading frame and preferably will not create complementary regions that could produce secondary mRNA structure. See, for example, EP Patent Application Publication No. 75,444.

In this manner, the present invention encompasses the antipathogenic proteins as well as components and fragments thereof. That is, it is recognized that component polypeptides or fragments of the proteins may be produced which retain antipathogenic protein activity that enhances disease resistance in a plant. These fragments include truncated sequences, as well as N-terminal, C-terminal, internal and internally deleted amino acid sequences of the proteins.

The deletions, insertions, and substitutions of the protein sequences encompassed herein are not expected to produce radical changes in the characteristics of the antipathogenic proteins. However, when it is difficult to predict the exact effect of the substitution, deletion, or insertion in advance of doing so, one skilled in the art will appreciate that the effect will be evaluated by routine screening assays. That is, the activity of the modified protein sequences can be evaluated by monitoring of the plant defense system. See, for example U.S. Patent No. 5.614,395, herein incorporated by reference.

The nucleotide sequences of the invention can be used to isolate corresponding sequences from other organisms, particularly other plants, more particularly other monocots. In this manner, methods such as PCR, hybridization, and the like can be used to identify such sequences based on their sequence homology to the sequences set forth herein. Sequences isolated based on their sequence identity to the entire antipathogenic sequences set forth herein or to fragments thereof are encompassed by the present invention.

In a PCR approach, oligonucleotide primers can be designed for use in PCR reactions to amplify corresponding DNA sequences from cDNA or genomic DNA extracted from any plant of interest. Methods for designing PCR primers and PCR cloning are generally known in the art and are disclosed in Sambrook et al. (1989) Molecular Cloning: A Laboratory Manual (2d ed., Cold Spring Harbor Laboratory Press, Plainview, New York). See also Innis et al., eds. (1990) PCR Protocols: A Guide to Methods and Applications (Academic Press, New York); Innis and Gelfand, eds. (1995) PCR Strategies (Academic Press, New York); and Innis and Gelfand, eds. (1999) PCR Methods Manual (Academic Press, New York). Known methods of PCR include, but are not limited to, methods using paired primers, nested primers, single specific primers, degenerate primers, gene-specific primers, vector-specific primers, partially-mismatched primers, and the like.

30

In hybridization techniques, all or part of a known nucleotide sequence is used as a probe that selectively hybridizes to other corresponding nucleotide sequences present in a population of cloned genomic DNA fragments or cDNA fragments (c. c., genomic or cDNA feraries) from a chosen organism. The hybridization probes may be genomic DNA fragments, cDNA fragments, RNA fragments, or other oligonucleotides, and may be labeled with a detectable group such as ³²P. or any other detectable marker. Thus, for example, probes for hybridization can be made by labeling synthetic oligonucleotides based on the antipathogenic sequences of the invention. Methods for preparation of probes for hybridization and for construction of cDNA and genomic libraries are generally known in the art and are disclosed at Sambrook et al. (1989) Molecular Cloning: A Laboratory Manual (2d ed., Cold Spring Harbor Laboratory Press, Plainview, New York).

For example, the entire antipathogenic sequence disclosed herein, or one or more portions thereof, may be used as a probe capable of specifically hybridizing to corresponding antipathogenic sequence or messenger RNAs. Additionally, the promoter sequences described herein, or one or more portions thereof, may be used a as a probe capable of hybridizing to corresponding promoter sequences.

To achieve specific hybridization under a variety of conditions, such probes include sequences that are unique among antipathogenic sequences or promoter sequence and are preferably at least about 10 nucleotides in length, and most

preferably at least about 20 nucleotides in length. Such probes may be used to amplify corresponding antipathogenic sequences or promoter sequences from a chosen plant by PCR. This technique may be used to isolate additional coding sequences from a desired plant or as a diagnostic assay to determine the presence of coding sequences in a plant. Hybridization techniques include hybridization screening of plated DNA libraries (either plaques or colonies; see, for example, Sambrook et al. (1989) Molecular Cloning: A Laboratory Manual (2d ed., Cold Spring Harber Laboratory Press, Plainview, New York).

Hybridization of such sequences may be carried out under stringent conditions. By "stringent conditions" or "stringent hybridization conditions" is intended conditions under which a probe will hybridize to its target sequence to a detectably greater degree than to other sequences (e.g., at least 2-fold over background). Stringent conditions are sequence-dependent and will be different in different circumstances. By controlling the stringency of the hybridization and/or washing conditions, target sequences that are 100% complementary to the probe can be identified (homologous probing). Alternatively, stringency conditions can be adjusted to allow some mismatching in sequences so that lower degrees of similarity are detected (heterologous probing). Generally, a probe is less than about 1000 nucleotides in length, preferably less than 500 nucleotides in length.

Typically, stringent conditions will be those in which the salt concentration is less than about 1.5 M Na ion, typically about 0.01 to 1.0 M Na ion concentration (or other salts) at pH 7.0 to 8.3 and the temperature is at least about 30°C for short probes (e.g. 10 to 50 nucleotides) and at least about 60°C for long probes (e.g., greater than 50 nucleotides). Stringent conditions may also be achieved with the addition of destabilizing agents such as formamide. Exemplary low stringency conditions include hybridization with a buffer solution of 30 to 35% formamide, 1 M NaCl, 1% SDS (sodium dodecyl sulphate) at 37°C, and a wash in 1X to 2X SSC (20X SSC = 3.0 M NaCl/0.3 M trisodium citrate) at 50 to 55°C. Exemplary moderate stringency conditions include hybridization in 40 to 45% formamide, 1.0 M NaCl 1% SDS at 37°C, and a wash in 0.5X to 1X SSC at 55 to 60°C. Exemplary righ stringency conditions include hybridization in 50% formamide, 1 M NaCl, 1% SDS at 37°C, and a wash in 0.1X SSC at 60 to 65°C. Duration of

hybridization is generally less than about 24 hours, usually about 4 to about 12 hours.

Specificity is typically the function of post-hybridization washes, the critical factors being the ionic strength and temperature of the final wash solution. 5 For DNA-DNA hybrids, the T_m can be approximated from the equation of Meinkoth and Wahl (1984) Anal. Biochem. 138:267-284: $T_m = 81.5^{\circ}C + 16.6$ (log M) + 0.41 (%GC) - 0.61 (% form) - 500/L; where M is the molarity of monovalent cations. %GC is the percentage of guanosine and cytosine nucleotides in the DNA. % form is the percentage of formamide in the hybridization solution, and L is the 10 length of the hybrid in base pairs. The T_m is the temperature (under defined ionic strength and pH) at which 50% of a complementary target sequence hybridizes to a perfectly matched probe. T_m is reduced by about 1°C for each 1% of mismatching; thus, T_m, hybridization, and/or wash conditions can be adjusted to hybridize to sequences of the desired identity. For example, if sequences with >90% identity 15 are sought, the T_{rt} can be decreased 10°C. Generally, stringent conditions are selected to be about 5°C lower than the thermal melting point (T_m) for the specific sequence and its complement at a defined ionic strength and pH. However, severely stringent conditions can utilize a hybridization and/or wash at 1, 2, 3, or 4°C lower than the thermal melting point (T_m); moderately stringent conditions can 20 utilize a hybridization and/or wash at 6, 7, 8, 9, or 10°C lower than the thermal melting point (T_m); low stringency conditions can utilize a hybridization and/or wash at 11, 12, 13, 14, 15, or 20°C lower than the thermal melting point (T_m). Using the equation, hybridization and wash compositions, and desired T_m, those of ordinary skill will understand that variations in the stringency of hybridization 25 and/or wash solutions are inherently described. If the desired degree of mismatching results in a T_m of less than 45°C (aqueous solution) or 32°C (formamide solution), it is preferred to increase the SSC concentration so that a higher temperature can be used. An extensive guide to the hybridization of nucleic acids is found in Tijssen (1993) Laboratory Techniques in Biochemistry and 30 Molecular Biology—Hybridization water Nucleic Acid Probes, Part I, Chapter 2 (Elsevier, New York); and Ausubel et al., eds. (1995) Current Protocols in

Molecular Biology, Chapter 2 (Greene Publishing and Wiley-Interscience, New

York). See Sambrook et al. (1989) Molecular Cloning: A Laboratory Manual (2d ed., Cold Spring Harbor Laboratory Press, Plainview, New York).

Thus, isolated sequences that either have promoter activity or encode for a antipathogenic protein and which hybridize under stringent conditions to the sequences disclosed herein, or to fragments thereof, are encompassed by the present invention. Such sequences will be at least 40% to 50% homologous, about 60% to 70% homologous, and even about 75%, 80%, 85%, 87%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97% to 98% homologous or more with the disclosed sequences. That is, the sequence identity of sequences may range, sharing at least 40% to 50%, about 60% to 70%, and even about 75%, 80%, 85%, 87%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97% to 98% or more sequence identity.

5

10

15

30

The following terms are used to describe the sequence relationships between two or more nucleic acids or polynucleotides: (a) "reference sequence", (b) "comparison window", (c) "sequence identity", (d) "percentage of sequence identity", and (e) "substantial identity".

- (a) As used herein, "reference sequence" is a defined sequence used as a basis for sequence comparison. A reference sequence may be a subset or the entirety of a specified sequence: for example, as a segment of a full-length cDNA or gene sequence, or the complete cDNA or gene sequence.
- 20 (b) As used herein, "comparison window" makes reference to a contiguous and specified segment of a polynucleotide sequence, wherein the polynucleotide sequence in the comparison window may comprise additions or deletions (i.e., gaps) compared to the reference sequence (which does not comprise additions or deletions) for optimal alignment of the two sequences. Generally, the comparison window is at least 20 contiguous nucleotides in length, and optionally can be 30, 40, 50, 100, or longer. Those of skill in the art understand that to avoid a high similarity to a reference sequence due to inclusion of gaps in the polynucleonde sequence a gap penalty is typically introduced and is subtracted from the number of matches
 - Methods of alignment of sequences for comparison are well known in the art. Thus, the determination of percent sequence identity between any two sequences can be accomplished using a mathematical algorithm. Preferred, non-limiting examples of such mathematical algorithms are the algorithm of Myers and

Miller (1988) CABIOS 4:11-17; the local homology algorithm of Smith et al. (1981) Adv. Appl. Math. 2:482; the homology alignment algorithm of Needleman and Wunsch (1970) J. Mol. Biol. 48:443-453; the search-for-similarity-method of Pearson and Lipman (1988) Proc. Nati. Acad. Sci. 85:2444-2448; the algorithm of Karlin and Altschul (1990) Proc. Natl. Acad. Sci. USA 872264, modified as in Karlin and Altschul (1993) Proc. Natl. Acad. Sci. USA 90:5873-5877.

20

25

30

Computer implementations of these mathematical algorithms can be utilized for commission of sequences to determine sequence identity. Such implementations include, but are not limited to: CLUSTAL in the PC/Gene program (available from Intelligenatics Mountain View, California); the ALIGN program (Version 2.0) and GAP, BFSTFIT, BLAST, FASTA, and TFASTA in the Wisconsin Cenetics Software Package, Version 8 (available from Genetics Computer Group (GCG), 575 Science Drive, Madison, Wisconsin, USA). Alignments using these programs can be performed using the default parameters. The CLUSTAL program is well described by Higgins et al. (1988) Gene 73:237-244 (1988); Higgins et al. (1989) CABIOS 5:151-153; Corpet et al. (1988) Nucleic Acids Res. 16:19881-90; Huang et al. (1992) CABIOS 8:155-65; and Pearson et al. (1994) Meth. Mol. Biol. 24:307:331. The ALIGN program is based on the algorithm of Myers and Miller (1988) supra A PAM120 weight residue table, a gap length penalty of 12, and a gap penalty of 4 can be used with the ALIGN program when comparing amino acid sequences. The BLAST programs of Altschul et al (1990) J. Mol. Biol. 215:403 are based on the algorithm of Karlin and Altschul (1990) supra. BLAST nucleotide searches can be performed with the BLASTN program, score = 100, wordlength = 12, to obtain nucleotide sequences homologous to a nucleotide sequence encoding a protein of the invention. BLAST protein searches can be performed with the BLASTX program, score = 50, wordlength = 3, to obtain amino acid sequences homologous to a protein or polypeptide of the invention. To obtain gapped alignments for comparison purposes, Gapped BLAST (in BLAST 2.0) can be utilized as described in Altschul et al. (1997) Nucleic Acids Res. 25.3389. Alternatively, PSI-BLAST (in BLAST 2.0) can be used to perform an iterated search that detects distant relationships between molecules. See Altschul et al. (1997) supra. When utilizing BLAST,

Gapped BLAST, PSI-BLAST, the default parameters of the respective programs

(e.g., BLASTN for nucleotide sequences, BLASTX for proteins) can be used. See http://www.ncbi.nlm.nih.gov. Alignment may also be performed manually by inspection.

5

10

25

30

For purposes of the present invention, comparison of nucleotide or protein sequences for determination of percent sequence identity to the promoter sequence or the anity athogenic sequences disclosed herein is preferably made using the Clustal W program (Version 1.7 or later) with its default parameters or any equivalent program. By "equivalent program" is intended any sequence comparison program that, for any two sequences in question, generates an alignment having identical nucleotide or amino acid residue matches and an identical percent sequence identity when compared to the corresponding alignment generated by the preferred program.

- As used herein, "sequence identity" or "identity" in the context of (c) two nucleic acid or polyreptide secrences makes reference to the residues in the 15 two sequences that are the same when aligned for maximum correspondence over a specified comparison window. When percentage of sequence identity is used in reference to proteins it is recognized that residue positions which are not identical often differ by conservative amino acid substitutions, where amino acid residues are substituted for other amino acid residues with similar chemical properties (e.g., charge or hydrophobicity) and therefore do not change the functional properties of 20 the molecule. When sequences differ in conservative substitutions, the percent sequence identity may be adjusted unwards to correct for the conservative nature of the substitution. Sequences that differ by such conservative substitutions are said to have "sequence similarity" or "similarity". Means for making this adjustment are well known to those of skill in the art. Typically this involves scoring a conservative substitution as a partial rather than a full mismatch, thereby increasing the percentage sequence identity. Thus, for example, where an identical amino acid is given a score of I and a non-conservative substitution is given a score of zero, a conservative substitution is given a score between zero and 1. The scoring of conservative substitution; is calculated, e.g., as implemented in the program PC/GENE (Intelligeneries, Mountain View, California).
 - As used herein, "percentage of sequence identity" means the value (b) determined by comparing two optimally aligned sequences over a comparison

window, wherein the portion of the aclynucleotide sequence in the comparison window may comprise additions or deletions (i.e., gaps) as compared to the reference sequence (which does not comprise additions or deletions) for optimal alignment of the two sequences. The percentage is calculated by determining the number of positions at which the identical nucleic acid base or amino acid residue occurs in both sequences to yield the number of matched positions, dividing the number of matched positions by the total number of positions in the window of comparison, and multiplying the result by 100 to yield the percentage of sequence identity.

that a polynucleotide comprises a sequence that has at least 70% sequence identity, preferably at least 80%, more preferably at least 90%, and most preferably at least 95%, compared to a reference sequence using one of the alignment programs described using standard parameters. One of skill in the art will recognize that these values can be appropriately adjusted to determine corresponding identity of proteins encoded by two nucleotide sequences by taking into account codon degeneracy, amino acid similarity, reading frame positioning, and the like.

Substantial identity of amino acid sequences for these purposes normally means sequence identity of at least 60%, more preferably at least 70%, 80%, 90%, and most preferably at least 95%.

10

15

20

25

30

Another indication that nucleotide sequences are substantially identical is if two molecules hybridize to each other under stringent conditions. Generally, stringent conditions are selected to be about 5° C lower than the thermal melting point (T_m) for the specific sequence at a defined ionic strength and pH. However, stringent conditions encompass temperatures in the range of about 1° C to about 20° C lower than the T_m , depending upon the desired degree of stringency as otherwise qualified herein. Nucleic acids that do not hybridize to each other under stringent conditions are still substantially identical if the polypeptides they encode are substantially identical. This may occur, e.g., when a copy of a nucleic acid is created using the maximum coden degeneracy permitted by the genetic code. One indication that two nucleic acid sequences are substantially identical is when the polypeptide encoded by the first nucleic acid is immunologically cross reactive with the polypeptide encoded by the second nucleic acid.

that a peptide comprises a sequence with at least 70% sequence identity to a reference sequence, preferably 80%, more preferably 85%, most preferably at least 90% or 95% sequence identity to the reference sequence over a specified comparison window. Preferably, optimal alignment is conducted using the homology alignment algorithm of Needleman and Wunsch (1970) J. Mol. Biol. 48:443-453. An indication that two peptide sequences are substantially identical is that one peptide. Thus, a peptide is substantially identical to a second peptide, for example, where the two peptides differ only by a conservative substitution. Peptides that are "substantially similar" share sequences as noted above except that residue positions that are not identical may differ by conservative amino acid changes.

10

15

20

25

30

The anti-pathogenic genes and proteins as well as the anti-pathogenic homologue genes and proteins of the invention can also be used to control resistance to pathogens by enhancing the defense mechanisms in a plant. While the exact function of the anti-pathogenic homologues is not known, they are involved in influencing the expression of defense-related proteins. It is recognized that the present invention is not premised upon any particular mechanism of action of the anti-pathogenic genes. It is sufficient for purposes of the invention that the genes and proteins are involved in the plant defense system and can be used to increase resistance levels in the plant to pathogens.

The plant defense mechanisms described herein may be used alone or in combination with other proteins or agents to protect against plant diseases and pathogens. Other plant defense proteins include those described in copending applications entitled "Methods for Enhancing Disease Resistance in Plants", U.S. Application Serial No. 60/076,151 filed February 26, 1998, and U.S. Application Serial No. 60/092,464, filed July 11, 1998, and copending application entitled "Genes for Activation of Plant Pathogen Defense Systems", U.S. Application Serial No. 60/076,683, filed February 26, 1993, all of which are herein incorporated by reference.

The nucleotide sequences of the invention can be introduced into any plant.

The genes to be introduced can be conveniently used in expression cassettes for introduction and expression in any plant of interest.

Such expression cassettes will comprise a transcriptional initiation region linked to the nucleotide sequence of interest. Such an expression cassette is provided with a plurality of restriction sites for insertion of the gene of interest to be under the transcriptional regulation of the regulatory regions. The expression cassette may additionally contain selectable marker genes.

The transcriptional initiation region, the promoter, may be native or analogous or foreign or heterologous to the plant host. Additionally, the promoter may be the natural sequence or alternatively a synthetic sequence. By foreign is intended that the transcriptional initiation region is not found in the native plant into which the transcriptional initiation region is introduced. As used herein a chimeric gene comprises a coding sequence operably linked to a transcription initiation region that is heterologous to the coding sequence.

10

15

20

25

30

The transcriptional cassette will include in the 5'-3' direction of transcription, a transcriptional and translational initiation region, a DNA sequence of interest, and a transcriptional and translational termination region functional in plants. The termination region may be native with the transcriptional initiation region, may be native with the DNA sequence of interest, or may be derived from another source. Convenient termination regions are available from the Ti-plasmid of A. tumefaciens, such as the octobine synthase and nopaline synthase termination regions. See also, Guerineau et al. (1991) Mol. Gen. Genet. 262:141-144;
Proudfoot (1991) Cell 64:671-674; Sanracon et al. (1991) Genes Dev. 5:141-149;
Mogen et al. (1990) Plant Cell 2:1261-1272; Munroe et al. (1990) Gene 91:151-158; Ballas et al. 1989) Nuc. Acids Pes. 17:7891-7903; Joshi et al. (1987) Nuc. Acid Res. 15:9627-9639.

A number of promoters can be used in the practice of the invention. An inducible promoter can be used to drive the expression of the genes of the invention. The inducible promoter will be expressed in the presence of a pathogen to prevent infection and disease symptoms. Such promoters include those from pathogenesis-related proteins (PR aroteins), which are induced following infection by a pathogen e.g., PR proteins, SAR proteins, beta-1,3-glucanase, chitinase, etc.

See, for example, Redolfi et al. (1983) Neth. J. Plant Pathol. 89:245-254; Uknes et al. (1992) Plant Cell 4:645-656; and Van Loon (1985) Plant Mol. Virol. 4:111-116. See, also the copending applications entitled "Inducible Maize Promoters", U.S. Application Serial No. 60/076,100, filed February 26, 1998 and U.S. Application Serial No. 60/079,648, filed February 27, 1998, and herein

5

30

incorporated by reference.

Of interest are promoters that are expressed locally at or near the site of pathogen infection. See, for example. Marineau et al. (1987) Plant Mol. Biol. 1:335-342; Matton et al. (1989) Molecular Plant-Microbe Interactions 2:325-331;

Somsisch et al. (1986) Proc. Natl. Acad. Sci. USA 83:2427-2430; Somsisch et al. (1988) Molecular and General Genetics 2:93-98; and Yang (1996) Proc. Natl. Acad. Sci. USA 93:14972-14977. See also, Chen et al. (1996) Plant J. 10:955-966; Zhang et al. (1994) Proc. Natl. Acad. Sci. USA 91:2507-2511; Warner et al. (1993) Plant J. 3:191-201: Siebertz et al. (1989) Plant Cell 1:961-968; and the references cited therein. Of particular interess is the inducible promoter for the maize PRms gene, whose expression is induced by the pathogen Fusarium moniliforme (see, for example, Corders et al. (1992) Physiol. Mol. Plant Path. 41:189-200).

Additionally, as pathogens find entry into plants through wounds or insect damage, a wound inducible promoter may be used in the constructions of the invention. Such wound inducible promoters include potato proteinase inhibitor (pin II) gene (Ryan et al. Ann. Rev. Phytopath. 28:425-449; Duan et al. Nature Biotechnology 14:494-498): wun1 and wun2, U.S. Patent No. 5,428,148; win1 and win2 (Stanford et al. Mol. Gen Genet 215:200-208); systemin (McGurl et al. Science 225:1570-1573); WIP1 (Rohmeier et al. Plant Mol. Biol. 22:783-792;

25 Eckelkamp et al. FEBS Letters 323.73-76); MPI gene (Corderok et al. Plant Journal 6(2):144-150); and the like, herein incorporated by reference.

Constitutive promoters include, for example, the Rsyn7 (copending U.S. Application Serial No. 08/661,601), the scp1 promoter (copending U.S. Application Serial No. 09/028 819) the ucp promoter, 35S CaMV promoter, and the like Other constitutive promoters include, for example, U.S. Patent Nos. 5,608,149; 5,608,144; 5,604,121; 5,569,597; 5,466,785; 5,399,680; 5,268,463; 5,608,142. See also, copending application entitled "Constitutive Maize

Promoters", U.S. Application Serial No. 60/076.075, filed February 26, 1998, and herein incorporated by reference.

Tissus-preferred promoters include Yarnamoto et al. (1997) Plant J. 12(2):255-265; Kawamata et al. (1997) Plant Cell Physiol. 38(7):792-803; Hansen et al. (1997) Mol Gen Genet. 254(3):337-343; Russell et al. (1997) Transgenic Res. 6(2):157-168; Rinehart et al. (1996) Plant Physiol. 112(3):1331-1341; Van Camp et al. 30

The nucleotide sequences for the constitutive promoters disclosed in the present invantion, as well as variants and fragments thereof, are useful in the genetic manipulation of any plant when assembled within a DNA construct such that the promoter sequence is operably linked with a heterologous nucleotide sequence whose constitutive empression is to be controlled to achieve a desired phenotypin response. By "operably linked" is intended the transcription or translation of the heterologous nucleotide sequence is under the influence of the promoter sequence. In this manner, the nucleotide sequences for the promoters of the invention are provided in expression cassettes along with heterologous nucleotide sequences for expression in the plant of interest. It is recognized that the promoter sequences of the invention may also be used with their native coding sequences to increase or decrease expression of the native coding sequence, thereby resulting in a change in phecotype in the transformed plant.

The promoter nucleotide sequences and methods disclosed herein are useful in regulating expression of any heterologous nucleotide sequence in a host plant in order to vary the phenotype of a plant. Various changes in phenotype are of interest including modifying the fatty acid composition in a plant, altering the amino acid content of a plant, altering a plant's pathogen defense mechanism, and the like. These results can be achieved by providing expression of heterologous products or increased expression of endogenous products in plants. Alternatively, the results can be achieved by providing for a reduction of expression of one or

more endogenous products, particularly enzymes or cofactors in the plant. These changes result in a change in phenotype of the transformed plant.

Gener of interest are reflective of the commercial markets and interests of those involved in the development of the crop. Crops and markets of interest change, and as developing nations open up world markets, new crops and technologies will emerge also. In addition, as our understanding of agronomic traits and characteristics such as yield and heterosis increase, the choice of genes for transformation will change accordingly. General categories of genes of interest include for example, those genes involved in information, such as zinc fingers, those involved in communication, such as kinases, and those involved in housekeeping such as heat shock proteins. More specific categories of transgenes, for example, include genes encoding important traits for agronomics, insect resistance, disease resistance, herbicide resistance, sterility, grain characteristics, and commercial products. Genes of interest include, generally, those involved in oil, starch, carbohydrate, or nutrient metabolism as well as those affecting kernel size, sucrose loading, and the like.

10

15

20

25

Agreemically important traits such as oil, starch, and protein content can be genetically altered in addition to using traditional breeding methods.

Modifications include increasing content of oleic acid, saturated and unsaturated oils, increasing levels of lysine and sulfur, providing essential amino acids, and also modification of starch. Hordothionin protein modifications are described in U.S. Patent Nos. 5,703,049, 5,885,801, 5,885,802, and 5,990,389; herein incorporated by reference. Another example is lysine and/or sulfur rich seed protein encoded by the soybean 2S albumin described in U.S. Serial No. 08/618,911, filed March 29, 1996, and the chymotrypsin inhibitor from barley, Williamson et al. (1987) Eur. J. Biochem. 165:99-106, the disclosures of which are herein incorporated by reference.

Derivatives of the coding sequences can be made by site directed mutagenesis to increase the level of preselected amino acids in the encoded polypeptide. For example, the gene encoding the barley high lysine polypeptide (BHL) is derived from barley chymotrypsin inhibitor. U.S. Serial No. 08/740,682, filed November 1, 1996, and PCT/US97/20441, filed October 31, 1997, the disclosures of each are incorporated herein by reference. Other proteins include

methionine-rich plant proteins such as from sunflower seed (Lilley et al. (1989)

Proceedings of the World Congress on Vegetable Protein Utilization in Human

Foods and Asimal Feedstuffs, ed. Applewhite (American Oil Chemists Society,

Champaign, Illinois), pp. 497-502; herein incorporated by reference)); com

(Pedersen et al. (1986) J. Biol. Chem. 261:6279; Kirihara et al. (1988) Gene

71:359; both of which are herein incorporated by reference); and rice (Musumura et al. (1989) Plant Mol. Biol. 12:123, herein incorporated by reference). Other agronomically important genes encode latex, Floury 2, growth factors, seed storage factors, and conscription factors.

Insect resistance genes may encode resistance to pests that have great yield drag such as rootworm, cutworm. European Corn Borer, and the like. Such genes include, for example Bacillus thuringiensis toxic protein genes (U.S. Patent Nos. 5,366.892; 5.747.450; 5,736,514; 5,723,756; 5,593,881; Geiser et al. (1986) Gene 48:109); lectins (Van Damme et al. (1994) Plant Mol. Biol. 24:825); and the like.

10

15

20

25

30

Genes encoding disease resistance traits include detoxification genes, such as against formonosin (U.S. Patent Application Serial No. 08/484,815, filed June 7, 1995); avindence (EVY) and disease resistance (R) genes (Jones et al. (1994)

Science 266:789: Martin et al. (1993) Science 262:1432; Mindrinos et al. (1994)

Cell 78:1089: and the like.

Herbicide resistance traits may include genes coding for resistance to herbicides that act to inhibit the action of acetolactate synthase (ALS), in particular the sulfonylurea-type herbicides (e.g., the acetolactate synthase (ALS) gene containing mutations leading to such resistance, in particular the S4 and/or Hra mutations: genes coding for resistance to herbicides that act to inhibit action of glutamine synthase, such as phosphinothricin or basta (e.g., the *bar* gene), or other such genes known in the art. The *bar* gene encodes resistance to the herbicide basta, the notif gene encodes resistance to the antibiotics kanamycin and geneticin, and the ALS gene encodes resistance to the herbicide chlorsulfuron.

Sterility genes can also be encoded in an expression cassette and provide an alternative to physical detessaling. Examples of genes used in such ways include male tissue-mederned genes and genes with male sterility phenotypes such as QM, described in U.S. Patent No. 5.583.210. Other genes include kinases and those encoding compounds toxic to either male or female gametophytic development.

The quality of grain is reflected in traits such as levels and types of oils, saturated and unsaturated, quality and quantity of essential amino acids, and levels of cellulose. In corn. modified hordothicain proteins, described in U.S. Patent Nos. 5,703,049, 5,835,801, 5,885,802, and 5,990,389, provide descriptions of modifications of proteins for desired purposes.

5

20

25

30

Commercial traits can also be encoded on a gene or genes that could increase for example, starch for ethanol production, or provide expression of proteins. Another important commercial use of transformed plants is the production of polymers and bioplastics such as described in U.S. Patent No.

5,602,321 [ssyled February 11, 1997] (Fenes such as B-Ketothiolase, PHBase (polyhydroxybultyrate synthase) and apstoacetyl-CoA reductase (see Schubert et al. (1988) J. Baccariol (179:5837-5847) facilitate expression of polyhyroxyalkanoates (PHAs).

from other sources including procurvotes and other eucaryotes. Such products include enzymes, cofactors, hormones and the like. The level of proteins, particularly modified proteins having improved amino acid distribution to improve the nutrient value of the plant, can be increased. This is achieved by the expression of such proteins having enhanced amino acid content.

Thus, the heterologous nucleotide sequence operably linked to one of the constitutive promoters disclosed herein may be a structural gene encoding a protein of interest. Examples of such heterologous genes include, but are not limited to, genes encoding proteins conferring resistance to abiotic stress, such as drought, temperature salinity, and toxins such as pesticides and herbicides, or to biotic stress, such as attacks by fingi, virtuses, bacteria, insects, and nematodes, and development of diseases associated with these organisms. More particularly, the constitutive promoters disclosed herein and identified as weak constitutive promoters are useful in transforming plants to constitutively express an avirulence gene as disclosed in the copending applications both entitled "Methods for Enhancing (viscuse Resistance in Pionis." U.S. Application Serial No. 60/075,151, filed February 26, 1898, and U.S. Application Serial No. 60/092,464, filed July 11, 1998, both of which are herein incorporated by reference. Such weak promoters may cause activation of the plant defense system short of hypersensitive cell death.

Thus, there is an activation of the plant defense system at levels sufficient to protect from pathogen invasion. In this state, there is at least a partial activation of the plant defense system wherein the plant produces increased levels of antipathogenic factors such as PR proteins, i.e., PR-1, cattiness, a-glucanases, etc.; secondary metabolites; phytoalexins; reactive oxygen species; and the like.

5

10

15

20

25

30

Alternatively, the heterologous nucleotide sequence operably linked to one of the constitutive promoters disclosed herein may be an antisense sequence for a targeted gene. By "antisense DNA sucleotide sequence" is intended a sequence that is in inverse orientation to the 5' to 3' normal orientation of that nucleotide sequence. When delivered into a plant cell, expression of the antisense DNA sequence prevents normal expression of the DNA nucleotide sequence for the targeted gene. The antisense nucleotide sequence encodes an RNA transcript that is complementary to and capable of hybridizing to the endogenous messenger RNA (mRNA) produced by transcription of the DNA nucleotide sequence for the targeted gene. In this case, production of the native protein encoded by the targeted gene is inhibited to aphieve a desired phenotypic response. Thus the promoter sequences of inhibit expression of a native protein in the plant.

The genes and promoters of the invention are provided in expression cassettes for expression in the plant of interest. The cassette will include 5' and 3' regulatory sequences operably linked to the gene of interest. The cassette may additionally contain at least one additional gene to be cotransformed into the organism. Alternatively, the additional gene(s) can be provided on another expression, cassette. Where appropriate, the gene(s) may be optimized for increased expression in the transformed plant. That is, the genes can be synthesized using plant preferred codons for improved expression. Methods are available in the art for synthesizing plant preferred genes. See, for example, U.S. Patent Nos. 5,330,831, 5,436, 391, and Murray et al. (1989) Nuc. Acids Res. 17:477-498, herein incorporated by reference.

Add trenal sequence modifications are known to enhance gene expression in a cellular later. These teclide in mination of sequences encoding spurious polyadenyietien signals, exon-intron solide site signals, transposon-like repeats, and other such well-characterized sequences, which may be deleterious to gene

expression. The G-C content of the sequence may be adjusted to levels average for a given celebrar host, as calculated by reference to known genes expressed in the host cell. When possible, the sequence is modified to avoid predicted hairpin secondary mRNA structures.

5

10

15

20

25

The expression cassettes may additionally contain 5' leader sequences in the expression cassette construct. Such leader sequences can act to enhance translation. Translation leaders are known in the art and include: picornavirus leaders, for example, EMCV leader (Encephalomyocarditis 5' noncoding region) (Elroy-Stain and (1989) PN4S USA 86.6126-6139); potyvirus leaders, for example, Taivileader (Tobacco Etch Virus) (Allison et al. (1986); MDMV leader (Maiza Dwarf Massie Virus); Virology 154:9-20), and human immunoglobulin heavy-chain binding protein (BiP). (Maceiak et al. (1991) Nature 353:90-94; untranslated leader from the coat protein mRNA of alfalfa mosaic virus (AMV RNA 4), Gobling et al. (1987) Nature 325:622-625; tobacco mosaic virus leader (TMV), (Golia D.R. (1989) Molecular Biology of RNA 237-256; and maize chlorotic and the virus leader (MCVCV Commeter al. (1991) Virology 81:382-385). See a so the Della-Cioppa et al. (1987) Plant Physiology 84:965-968. Other methods known to enhance translation can also be utilized, for example, introns, and the like

In preparing the expression cassette, the various DNA fragments may be manipulated so as to provide for the DNA sequences in the proper orientation and, as appropriate, in the proper reading frame. Towards this end, adapters or linkers may be employed to join the DNA fragments or other manipulations may be involved to provide for convenient restriction sites, removal of superfluous DNA, removal of restriction sites, or the like. For this purpose, *in vitro* mutagenesis, primer repair, restriction, annealing, resubstitutions, e.g. transitions and transversions may be involved.

The genes of the present invention can be used to transform any plant. In this manner, generically modified plants, plant cells, plant tissue, seed, and the like can be obtained. Transformation propocols may vary depending on the type of plant or plant cells i.e. monocot or dicot targeted for transformation. Suitable methods of transforming plant cells include microinjection (Crossway et al. (1986) Biotechniques 4:320-334), electroporation (Riggs et al. (1986) Proc. Natl. Acad.

Sci. USA \$3:5502-5506, Agrobacterium modiated transformation (Hinchee et al. (1988) Biotechnology 6:915-921), direct gene transfer (Paszkowski et al. (1984) EMBO J. 3:2717-2722), and ballistic particle acceleration (see, for example, Sanford et al., U.S. Patent 4,945,050; Tomes et al. Direct DNA Transfer into Intact Plant Cells via Microprojectile Bombardment; In Gamborg and Phillips (Eds.) 5 Plant Cell. Tissue and Organ Culture: Fundamental Methods, Springer-Verlag, Berlin (1995); and McCabe et al. (1988) Biotechnology 6:923-926). Also see, Weissing word. (1988) Ann. Rev. Genev. 27:421-477; Sanford et al. (1987) Particulate Science and Technology 5:27-37 (onion); Christou et al. (1988) Plant Physiol. 87:571-674(soybean); McCabe et al. The cells, which have been transformed, may be grown into plants in

The cells, which have been transformed, may be grown into plants in accordance with conventional ways. See, for example, McCormick et al. (1986)

Plant Cell Reports 5:81-84. These plants may then be grown, and either pollinated with the same transformed strain or deferent strains, and the resulting hybrid having the desired phenotypic characteristic identified. Two or more generations may be grown to ensure that the subject phenotypic characteristic is stably

30

maintained and inherited and then sac is harvested to ensure the desired phenotype or other property has been achieved.

The methods of the invention can be used with other methods available in the art for enhancing disease resistance in plants.

5

10

15

20

25

30

Methods for increasing pathogen resistance in a plant are provided. The methods involve stably transforming a plant with a DNA construct comprising an anti-pathogenic nucleotide sequence of the invention operably linked to promoter that drives expression in a plant. Such methods find use in agriculture particularly in limiting the impact of plant pathogens on crop plants. The anti-pathogenic nucleotide sequences comprise sunflower genes. Particularly, the sunflower genes are selected from the genes encoding PR5, defensin and BBE. While the choice of promoter will depend on the desired timing and location of expression of the anti-pathogenic nucleotide sequences, preferred promoters include constitutive and pathogen-inducible premoters.

Methods are provided for increasing the resistance of a plant to a pathogen involving stably transforming a plant with a DNA construct comprising a nucleotide sequence of an inducible promoter of an antipathogenic gene of the invention operably linked to a second nucleotide sequence. Preferably, the promoter is selected from the promoters of genes encoding a PR5, a BBE homologue or a defensin. More preferably, the promoter has a nucleotide sequence selected from the sequences set forth in SEQ ID:7, SEQ ID:8, and SEQ ID:9. Although any one of a variety of second nucleotide sequences may be utilized, are learned embodiments of the invention encompass those second nucleotide sequences that, when expressed in a plant, help to increase the resistance of a plant to pathogens. It is recognized that such second nucleotide sequences may be used in either the sense or antisense orientation depending on the desired outcome.

Antisense nucleotides are constructed to hybridize with the corresponding mRNA. Modifications of the antisense sequences may be made as long as the sequences hybridize to and interfere with expression of the corresponding mRNA. In this mander, artisense constructions having 70%, preferably 80%, more preferably 85% sequence identity to the corresponding antisense sequences may be used. Furthermore, portions of the antisense nucleotides may be used to disrupt the

expression of the target gene. Generally, sequences of at least 50 nucleotides, 100 nucleotides, 200 nucleotides, of greater may be used. Examples of such second-nucleotide sequences include, but are not limited to, sequences encoding PRI, different members of defensin, or BBE, PR5, antifungal peptides such as tachyplesin, chitinases, glucanase, etc.

Additionally provided are transformed plants, plant cells, plant tissues and seeds thereof.

5

10

By "pathogenic agent" are intended pathogenic organisms such as fungi, bacteria, viruses, and disease causing microorganisms. Additionally included are nematodes, insects and the like. Pathogens of the invention include, but are not limited to viruses or viroids, bacteria insects, nematodes, fungi, and the like. Viruses include tobacco or cucumber mesaic virus, ringspot virus, necrosis virus, maize dwarf mesaic virus, etc.

Specific fungal and viral pathogens for the major crops include: Soybeans:

Phytophilic revego sperma fsp. glyvinec, Macrophomina phaseolina, Rhizoctonia solani, Solevatinia solerotiorum, Fusarium oxysporum, Diaporthe phaseolorum var. sojae (Phomopsis sojae). Diaporthe phaseolorum var. caulivora, Solerotium rolfsii, Cerca soora kikuchii, Cercaspara sojina, Peronospora manshurica, Colletotrichum dematium (Colletotichum truncatum), Corynespora cassiicola,

- Septoria gizzines. Phyllosticta sojicola, Alternaria alternata, Pseudomonas syringae vizzalycinea, Xanthomonas campestris p.v. phaseoli, Microsphaera diffusa Fuzzrium semitecium, Phiciophora gregata, Soybean mosaic virus, Glomerella glycines. Tobacco Ring spot virus, Tobacco Streak virus, Phakopsora pachyrhizi, Pyrhium aphanidermatum. Pythium ultimum. Pythium debaryanum,
- Tomato spotted wilt virus. Heterodera glycines Fusarium solani; Canola: Albugo candida. Alternaria brassicce, Leptosphaeria maculans, Rhizoctonia solani, Sclerotinia sclerotiorum, Mycosphaerella brassiccola, Pythium ultimum, Peronospora parasitica, Fusarium roseum, Alternaria alternata; Alfalfa: Clavibarer michiganese subsp. insidiosum, Pythium ultimum, Pythium irregulare,

 Ustilago mapalis, Puccinia sorghi, Puccinia polysora, Macrophomina phaseolina,
 Penicillium exalicum, Nigrospora orvzae, Cladosporium herbarum, Curvularia
 lunata, Curvularia masquolis, Curvularia pallescens, Clavibacter michiganense

subsp. nebraskensa. Trichoderma wiride, Maize Dwarf Mosaic Virus A & B, Wheat Streak Mosaic Virus, Maize Chlorotic Dwarf Virus, Claviceps sorghi, Pseudonomas avenae, Erwinia chrysanthemi pv. zea, Erwinia corotovora, Cornstunt spiroplasma, Diplodia macrospora, Sclerophthora macrospora,

- Peronosclerospora sorghi, Peronosclerospora philippinensis, Peronosclerospora maydis, Peronosclerospora sacchari, Spacelotheca reiliana, Physopella zeae, Cephalosporium maydis, Caphalosporium acremonium, Maize Chlorotic Mottle Virus, High Plains Virus, Maize Mosaic Virus, Maize Payado Fino Virus, Maize Streak Virus, Maize Stripe Virus, Maize Rough Dwarf Virus; Sorghum:
- 10 Exserohilur turcicum, Colletotrichum graminicola (Glomerella graminicola),
 Cercospora corghi, Gloeocercospora sorghi, Ascochyta sorghina, Pseudomonas
 syringae p v. svringae, Xanthomonas campestris p.v. holcicola, Pseudomonas
 andropogonis, Puccinia purpurea, Macrophomina phaseolina, Perconia circinata,
 Fusarium moniliforme, Alternaria alternate, Bipolaris sorghicola,
- 15 Helminthosparium sorghicola. Curvularia lunata. Phoma insidiosa, Pseudomonas avenae (Pseudomonas alicoprecipitans). Ramulispora sorghi, Ramulispora sorghi, Ramulispora sorghicola. Phytlachara sacchari. Soorisorium reilianum (Sphacelotheca reiliana), Sphacelotheca cruenta. Spozisorium sorghi. Sugarcane mosaic H, Maize Dwarf Mosaic Virus A & B. Claviceps sorghi, Rhizoctonia solani, Acremonium strictum,
- 20 Sclerophthona nacrospora, Peronescierospora sorghi. Peronosclerospora philippinensis, Sclerospora graminicola, Fusarium graminearum, Fusarium oxysporum, Evihium arrhenomenes. Pythium graminicola, etc.

Nematodes include parasitic nematodes such as root knot, cyst, reniform and lesion nematodes, etc.

Hymenoptera, Lepidoptera, Mallophaga. Homoptera, Hemiptera, Orthoptera, Thysanoptera Dermaptera, Isoptera Anoplura, Siphonaptera, Trichoptera, etc., particularly Coleoptera and Lepidoptera. Insect pests of the invention for the major crops include: Maize: Ostrinia nubilalis European com borer; Agrotis ipsilon, bisch curvorm: Helicoverpa vea com earworm; Spodoptera frugiperda, fall armywoom. Dictraea grandiosella, southwestern com borer; Elasmopalpus lignosellus. esser comstalk borer; Diatraea saccharalis, surgarcane borer; Diabrotica virgifera, western com poptyorm: Diabrotica longicornis barberi,

northern corts rootworm; Diabrotica undecimpunciata howardi, southern corn rootworm; Melanotus spp., wireworms; Cyclocephala borealis, northern masked chafer (white grub): Cyclocephala immaculata, southern masked chafer (white grub); Popil/la japonica, Japanese peetle: Chaetocnema pulicaria, com flea beetle; Sphenophorus maidis, maize billbug; Rhopalosiphum maidis, com leaf aphid; 5 Anuraphis maidiradicis, com root aphid; Blissus leucopterus leucopterus, chinch bug; Melanoplus femurrubrum. rediegged grasshopper; Melanoplus sanguinipes, migratory grasshopper Hylemva planura, seedcorn maggot; Agromyza parvicornis, com blot les fininer: Anaphothrips coscrurus, grass thrips; Solenopsis milesta, thief ant; Tetranichus urticae, twospettes spider mite, Sorghum: Chilo partellus, 10 sorghum borer: Spedoptera frygiperda, fall armyworm; Helicoverpa zea, com earworm: Flasmopalpus lignosellus, lesser cornstalk borer; Feltia subterranea, granulate cutworm; Phyllophaga crinita, white grub; Eleodes, Conoderus, and Aeolus spp, wireworms; Oulema rielanopus, cereal leaf beetle; Chaetocnema pulicaria, com flea beetle; Sphenophorus maidis, maize billbug; Rhopalosiphum 15 maidis: corn leaf aghid: Sipha flavo, yellow sugarcane aphid; Blissus leucopterus leucopterus, chinch bug; Contarinte sorghicola, sorghum midge; Tetranychus cinnabariere carmine spider mite: Tetranychus urticae, twospotted spider mite; Wheat: Pseudaletia unipunctata. army worm: Svodoptera frugiperda, fall armyworm; Elasmopalpus lignosellus, lesser cornstalk borer; Agrotis orthogonia, 20 western cutworm; Elasmopalpus lignosellus, lesser cornstalk borer; Oulema melanopus, cereal leaf heetle; Hypera punctata, clover leaf weevil; Diabrotica undecimpunctata howardi, southern com rootworm; Russian wheat aphid; Schizaphis graminum, greenbug; Macrosiphum avenae, English grain aphid; Melanoplus femurruhrum. redlegged grasshopper; Melanoplus differentialis, 25 differential grasshopper; Melanoplus sanguinipes, migratory grasshopper; Mayetiola destructor, Hessian fly; Sitodiplosis mosellana, wheat midge; Meromyza americana, wheat stem maggot; Hylemya coarctata, wheat bulb fly; Frankliniella fusca tobacco thrips; Cephus cinctus wheat stem sawfly; Aceria tulipae, wheat curl mite: Stadiower: Suleima heitanthana, sunflower bud moth; Homoeosoma 30 electellum, sinflower moth; zygogramma exclamationis, sunflower beetle; Bothyrus giphosus, carrot beetle: Neolosioptera murtfeldtiana, sunflower seed midge; Cotton: deliothis virescens, cotton budworm; Helicoverpa zea, cotton

bollworm; Special exigua, beet armyworm; Pectinophora gossypiella, pink bollworm; Anthonomus grandis, boll weevil; Aphis gossypii, cotton aphid; Pseudatomescelis seriatus, cotton flezhopper; Trialeurodes abutilonea, bandedwinged whitefly; Lygus lineolaris, tarnished plant bug; Melanoplus femurrubrum, redlegged grasshopper; Melanoplus differentialis, differential grasshopper; Thrips tabaci, onion thrips; Franklinkiella fusca, tobacco thrips; Tetranychus cinnabarinus, carmine soider mite; Tetranychus urticae, twospotted spider mite: Rice: Diatraea saccharalis, sugarcane borer; Spodoptera frugiperda, fall armyweren Helicoverpa zea, com eerworm; Colaspis brunnea, grape colaspis; Lissorhopurus prozophilus, rice water weevil; Sitophilus oryzae, rice weevil; 10 Nephotettiz igrometus, rice leashopper Blissus leucopterus leucopterus, chinch bug: Acrosterrum hilare, green stirk bug: Sovbean: Pseudoplusia includens, soybean loopor. Anticarsia gemmacalis, colvetbean caterpillar; Plathypena scabra, green cloverworm: Ostrinia nubilalis. European com borer; Agrotis ipsilon, black 15 cutworm; Sponoptera exigua, best arrayworm; Heliothis virescens, cotton budworm; Holloverna zea, cotton bollworm; Epilachna varivestis, Mexican bean beetle: Mysus persuae, green neach solid: Empeasca fahae, potato leafhopper; Acrosternu: hilare green stink bug: Mel mobles femurrubrum, redlegged grasshopper Melanoplus differentialis differential grasshopper; Hylemya platura, 20 seedcom mag vot: Sericothrips variabilis, soybean thrips; Thrips tabaci, onion thrips: Tetranychus turkestani, stramber y spider mite; Tetranychus urticae, twospotted spider mite; Barley: Ostrima nubilalis, European com borer; Agrotis ipsilon, black curvorm; Schizaphis granitum, greenbug; Blissus leucopterus leucopterus, chinch bug; Acrosternum bilare, green stink bug; Euschistus servus, brown stink bug; Delia platura, seedcore maggot; Mayetiola destructor, Hessian 25 fly: Petrobia latens, brown wheat mite; Oil Seed Rape: Brevicoryne brassicae, cabbage aphic: Phyllotreta cruciferae. Flea beetle; Mamestra configurata, Bertha armyworm; Plutella xylostella, Diemond-back moth; Delia ssp., Root maggots.

The present invention also provides is clated nucleic acids comprising polynucleousles of sufficient length and complementarity to a gene of the invention to use as mobiles or amplification primers in the detection, quantitation, or isolation of gene transcripts. For example, is classed nucleic acids of the present invention can be used as a robes in detecting deficiencies in the level of mRNA in screenings for

30

desired transgeries plants, for detecting mutations in the gene (e.g., substitutions, deletions, or additions), for monitoring apregulation of expression or changes in enzyme activity in screening assays of compounds, for detection of any number of allelic vanitus (pelymorphisms) of the same, or for use as molecular markers in plant breedly g programs. The isolated nucleic acids of the present invention can also be used for recombinant expression of polypeptides, or for use as immunogens in the preparation and/or screening of antibodies. The isolated nucleic acids of the present investion can also be employed for use in sense or antisense suppression of one or more series of the invention in a host cell, tissue, or plant. Attachment of chemical agence, which bind, internalate pleave and/or crosslink to the isolated nucleic acids of the present invention can also be used to modulate transcription or translation. A. then using a primar specific to an insertion sequence (e.g., transposon) and a primer which specifically hybridizes to an isolated nucleic acid of the present invention, one can use nucleic acid amplification to identity insertion sequence inactivated genes of the invention from a cDNA library prepared from insertion sequence mutagenized plants. Progeny seed from the plants comprising the desired in converted gene can be grown to a plant to study the phenotypic changes of a recertific of that machinalism. See Tools to Determine the Function of Genes 1995 Proceedings of the Fiftieth Annual Com and Sorghum Industry Research Conference, American Seed Trade Association, Washington, D.C., 1995. Additionally non-translated 5' or 3' regions of the polynucleotides of the present invention can be used to modulate turnover of heterologous mRNAs and/or protein synthesis. Farmer, the codon preference characteristic of the polynucleotides of the present invention can be employed in heterologous sequences, or altered in homologous or heterologous sequences to modulate translational level and/or rates.

10

15

20

25

The present invention provides a method of genotyping a plant comprising a polynucleotide of the present invention. The plant may be a monocot, such as maize or sorgnam, or alternatively, a dicot, such as sunflower or soybean.

Genotyping provides a means of distinguishing homologues of a chromosome pair and can be used to differentiate segregates in a plant population. Molecular marker methods and be used for phylogenetic studies, characterizing genetic relations are a mong crop varieties, tuestablying crosses or somatic hybrids,

localizing characterizal segments affecting monogenic traits, map based cloning, and the study of quantitative inheritance. See, e.g., Plant Molecular Biology: A Laboratory Microsol. Chapter 7, Clark. Ed., Springer-Verlag, Berlin (1997). For molecular marker methods, see generally, The DNA Revolution by Andrew H. Paterson 1996 (Chapter 2) in: Genome Mapping in Plants (ed. Andrew H.

Paterson) by Academic Press/R. G. Landis Company, Austin, Texas, pp. 7-21.

The particular method of genotyping in the present invention may employ any number. Incolecular marker analytic rechniques such as, but not limited to, restriction fragment length polymorphisms (RFLPs). Thus, the present invention further provines a means to follow segregation of a gene or nucleic acid of the present invention as well as chromosomal sequences genetically linked to these genes or nucleic acid is using such techniques as RFLP analysis. Linked chromosomal sequences are within 50 contiMorgans (cM), often within 40 or 30 cM, preferably within 20 or 10 cM, more preferably within 5, 3, 2, or 1 cM of a gene of the levention.

10

15

20

25

30

In the present invention, the nucleic acid probes employed for molecular marker manning of plant publicar genomes selectively hybridize, under selective hybridizar man additions, to a gene error ling a polynucleotide of the present invention. In preferred embodiments, the probes are selected from polynucleotides of the present invention. Typically, these probes are cDNA probes or *Pst I* genomic clones. The length of the probes is discussed in greater detail, *supra*, but are typically at least 15 bases in length, more preferably at least 20, 25, 30, 35, 40, or 50 bases in length. Generally, bowever, the probes are less than about 1 kilobase in length. Preferably, the probes are single copy probes that hybridize to a unique locus in a haploid chromosome complement.

The present invention further provides a method of genotyping comprising the steps of contacting, under stringent hydridization conditions, a sample suspected of comprising a polynucleotice of the present invention with a nucleic acid probe. Penerally, the sample is a plant sample; preferably, a sample suspected of the present invention (e.g., gene, mR/N). The nucleic acid or the selectively hybridizes, under stringent conditions. Calculate of a polynucleotide of the present invention comprising a polynucleotide of the present invention

probe to the polymorphic marker nucleic acid sequence yields a hybridization complex. Detection of the hybridization complex indicates the presence of that polymorphic marker in the sample. In preferred embodiments, the nucleic acid probe comprises a polynucleotide of the present invention.

Methods are provided for controlling plant pathogens comprising applying an anti-pathogenic amount of a protein or composition of the invention to the environment of the pathogens. By "controlling plant pathogens" is intended killing the pathogenic a preventing or limiting disease formation on a plant. By "anti-pathogenic a protein is intended an amount of a protein or composition that controls a principal. The proteins and compositions can be applied to the environment of the pathogen by methods known to those of ordinary skill in the art.

The proteins of the invention can be formulated with an acceptable carrier into a pessocidal composition(s) that is for example, a suspension, a solution, an emulsion, a dusting powder, a dispersible granule, a wettable powder, and an emulsifiable removementate, an aerosoi, an impregnated granule, an adjuvant, a coatable name and also empayable that is for example, polymer substances.

Such parties sitious disclose Labove may be obtained by the addition of a surface-active agent, an inert carrier, a preservative, a humectant, a feeding stimulant, an attractant, an encaosulating agent, a binder, an emulsifier, a dye, a U.V protectant, a buffer a flow agent or fertilizers, micronutrient donors or other preparations that influence plant growth. One or more agrochemicals including. but not braine to herbicides, insecticides, fungicides, bacteriocides, nematocides, molluscioides, acaracides, plant growth regulators, harvest aids and fertilizers, can be combine a with partiers, surfactants or adjuvants customarily employed in the art of formulation or other components to facilitate product handling and application for particular target pests. Suitable carriers and adjuvants can be solid or liquid and correspond to the substances ordinarily employed in formulation technology. e.g. natural or regenerated mineral substances, solvents, dispersants, wetting agents, tankillers, hunders or fertilizers. The active ingredients of the present invention are normally applied in the form of compositions and can be applied to the growning or offent to be treated simultaneously or in succession, with other compounds. Preferred methods of apolying an active ingredient of the present

invention or an agreehemical composition of the present invention, which contains at least one to the proteins of the present invention, are foliar application, seed coating and toil application. The number of applications and the rate of application depend on the intensity of infestation by the corresponding pest.

5

10

15

20

25

30

Suitable surface-active agents include, but are not limited to, anionic compounds such as a carboxylate of, for example, a metal; carboxylate of a long chain fatty acid; an N-acylsarcosinate; mono or di-esters of phosphoric acid with fatty alcohol ethoxy ates or salts of such estern fatty alcohol sulfates such as sodium doden di suifare, sodium octadecyl sulfate or sodium cetyl sulfate; ethoxylated they alcohol sulfates; ed explated alkylphenol sulfates; lignin sulfonates petroleum sulfonates; aikyl aryl sulfonates such as alkyl-benzene sulfonates or lower alkylnaphtalene sulfonates e.g. butyl-naphthalene sulfonate; salts of sulforered naphthalene-formaldehyde condensates; salts of sulfonated phenol-formaldehyde condensates; more complex sulfonates such as the amide sulfonates, the inifonated condensation product of oleic acid and N-methyl tauringt or the diality sulfa succinates a gathe sodium sulfonate or dioctyl succinare in a literation agents include nor densation products of fatty acid esters, fatty alcohols, fatry acid amides or fatry alkyd- or alkenyl-substituted phenols with ethylene oxide, fatty esters of polyhyddic alcohol ethers, e.g. sorbitan fatty acid esters, condensation products of such esters with ethylene oxide, e.g. polyoxyethylane sorbitar fatty acid esters block copolymers of ethylene oxide and propylene oxide acetylenic glycols such as 2, 4, 7, 9-tetraethyl-5-decyn-4, 7-diol, or ethoxylated acetylenic glycols. Examples of a cationic surface-active agent include, for instance, an aliphatic mono-, di, or polyamine such as an acetate, naphthenate or oleate: or oxygen-containing amine such as an amine oxide of polyoxyethy ene alkylamine; an amide-linked amine prepared by the condensation of a carboxytic acid with a di- or polyamine; or a quaternary ammonium salt.

Examples of inert materials include but are not limited to inorganic minerals such as kaolin, phyllosilicates, carbonates, sulfates, phosphates or botanical review its such as cork, powdered comoobs, peanut hulls, rice hulls, and walnut socks

The compositions of the present invention can be in a suitable form for direct application or as concentrate of pamary composition, which requires

dilution with a suitable quantity of water or other diluent before application. The pesticidal of note matter will vary depending upon the nature of the particular formulation, specifically, whether it is a concentrate or to be used directly. The composition contains 1 to 98% of a solid or liquid inert carrier, and 0 to 50%, preferably 0, to 50% of a surfactant. These compositions will be administered at the labeled attactor the commercial product, preferably about 0.01 lb-5.0 lb. per acre when in day form and at about 0.01 pts. - 10 pts. per acre when in liquid form.

5

10

15

20

25

30

In a circle embodiment, the compositions, as well as the proteins of the present in a strice can be treated prior with travalation to prolong the activity when applied to the previousment of a target pest as long as the pretreatment is not deleterious to the activity. Such treatment can be by chemical and/or physical means as long as the treatment does not deleteriously affect the properties of the composition(s). Examples of chemical reagents include but are not limited to halogenating agents; aldebydes such a formaldehyde and glutaraldehyde; anti-infectives, such as rephiran chloride; alcohols, such as isopropanol and ethanol; and histological linearizes, such as Boula's fixative and Helly's fixative (see, for example, the mason. Animal Tissue Techniques. W.H. Freeman and Co., 1967).

example, spraying aromizing dusting, scattering, coating or pouring, introducing into or on the soil, introducing into prigation water, by seed treatment or general application or dusting at the time when the pest has begun to appear or before the appearance of pests as a protective measure. It is generally important to obtain good control of pests in the early stages of plant growth, as this is the time when the plant can be most severely damaged. The compositions of the invention can conveniently contain another insecticide or pesticide if this is thought necessary.

Plants to be protected within the scope of the present invention include but are not limited to careals (wheat, barley, rye, oats, rice, sorghum and related crops), beets (sugar beet and fodder beet), drupes, pomes and soft fruit (apples, pears, plums, peaches, almonds, cherries, strawberries, raspberries, and blackberries), leguminous plants (alfalfa, beans, teardus, tentils, peas, soybeans), oil plants (rape, mustard, polyty, 1577es, sastlowers, sur liowers, coconuts, castor oil plants, cocoa beans, oil pains), encumber plants (on unober, matrows, melons), fiber plants (cotton, flax, hemp, jute), citrus fruit (oranges, lemons, limes, grapefruit,

mandarins) regerables (spinach, lettuce, asparagus, cabbages and other Brassicae, carrots, onious, tornatoes, potatoes, paorika), lauraceae (avocados, cinnamon, camphor), deciduous trees and conifers (e.g. linden-trees, yew-trees, oak-trees, alders, poplars, birch-trees, firs, larches, pines), or plants such as maize, turf plants, tobacco, nuts, coffee, sugar cane, tea, hops, bananas and natural rubber plants, as well as ornamentals

In a runther embodiment, formulations of the present invention for use as antimicrobia. Secure as comprise the anti-pathogenic proteins in a physiologically or pharmaceutically acceptable carrier, such as an aqueous carrier. Thus, formulations for use in the present invention include, but are not limited to, those suitable for parenteral administration, including subcutaneous, intradermal, intravaneous and intraacterial administration, as well as topical administration. The formulations may conveniently be presented in unit dosage form and may be prepared by any of the methods well-known in the art. Such formulation, the described in, for example, Remington's Phormaceutical Sciences 19th ed., Cool. A. (2011), Mack Fastor, PA (1980).

10

15

20

25

30

In the manufacture of a medicament according to the invention, the antipathogenic compositions are typically admixed with, inter alia, an acceptable
carrier. The correct must, of course, he acceptable in the sense of being compatible
with any other ingredients in the formulation and must not be deleterious or
harmful to the patient. The carrier may be a solid or a liquid. One or more antipathogenic merceins may be incorporated to the formulations of the invention,
which may be prepared by any of the well-known techniques of pharmacy
consisting assembally of admixing the components, optionally including one or
more accessory therapeutic ingredients.

Formulations of the present invention may comprise sterile aqueous and non-aqueous injection solutions of the active compound, which preparations are preferably common with the blood of intended recipient and essentially pyrogen free. These comparations may contain anti-caidants, buffers, bacteriostats and solutes and there are formulation soluted with the blood of the intended recipient. A placing and non-aqueous sterile suspensions may include suspending agents and thickering agents. The formulations may be presented in unit dose or multi-dose containers, for example sealed ampowles and vials, and may be stored

in a freeze-drea (lyophilized) condition requiring only the addition of the sterile liquid carrier, for example, saline or water-for-injection immediately prior to use.

In the formulation the anti-pathogenic protein may be contained within a lipid particle of vesicle, such as a liposome or microcrystal, which may be suitable for parenteral administration. The particles may be of any suitable structure, such as uniformity or plurilamellar, so long as the targeted cassette is contained therein. Positively charged lipids such as N-[1-Q13-dioleoyloxi)propyl]-N,N,N-trimethylamonium retaylsulfate, or "DOTA", are particularly preferred for such particles and vesicles. The preparation of such lipid particles is well-known. See, e.g., U.S. Patent Nos. 4,880.635 to Janoff et al.; 4,906.477 to Kurono et al.; 4,911,928 to Wallach; 4,917,951 to Wallach; 4,920.016 to Allen et al.; 4,921,757 to Wheatley et al.; etc.

The desage of the anti-pathogenic protein administered will vary with the particular method of administration, the condition of the subject, the weight, age, and sex of the subject, the particular formulation, the route of administration, etc. In general, the protein will be administered in a range of about 1µg/L to about 10g/L.

The following examples are offered by way of illustration and not by way of limitation

20

25

15

EXPERIMENTAL

Materials and Methods

Plant material

Sunflower plants were grown in the greenhouse and growth chamber. The sunflower line SMF 3 and oxox-transgenic sunflower (line 193870 and 610255) were used for RNA profiling study by CuraGen using methods described in U.S. Patent No. 5.871.697 to Rothberg et al., and U.S. Patent No. 5,972,693 to Rothberg et al., both incorporated herein by reference. Sunflower pathogen. Sclerotinia sclerotionum was maintained on plate at 20°C in dark.

30

Preparation of total RNAs for RNA profiling study and Northern analysis

Plant materials were ground in liquid nitrogen, and total RNA was extracted by the Tri-Reagent Method (Sigma). For each RNA profiling study, RNA

samples from 6-week-old sunflower leaves and stems of transgenic sunflower plants expressing a wheat oxalate oxidase gene were compared with those from sunflower line SMF3. Total RNA (20 µg) was separated in a 1% agarose gel containing formaldehye. Ethidium bromide was included to verify equal loading of RNA. After transfer onto Hybond N+ membrane (Amersham), the blots were hybridized with ³²P-labelled PR5, defensin or BBE cDNA probes. A duplicate blot was hybridized with an 18S rRNA probe as a control. Hybridization and washing conditions were performed according to Charch et al. (1984) Proc. Natl. Acad. Sci. USA 81:1991-1995.

10

15

30

RNA profiling technology

Total RNA was analyzed using the gene expression profiling process (Gene Calling@) as described in U.S. Patent No. 5,871,697, herein incorporated by reference. A number of distinct transcribes increased in abundance following the oxidative burst and cDNAs corresponding to a portion of these transcripts were cloned and sequenced.

Isolation of fall-length or flanking sequences by PCR amplification of cDNA ends

Three defense-related cDNAs were isolated by using RNA profiling and 20 PCR-based technologies. RNA profiling studies were conducted through the collaboration with CuraGen Corporation. Figure 1 illustrates the cloning strategy used. The sequence information generated was used for designing gene-specific primers to amplify both 3' and/or 5' end regions of the target genes using the PCRbased, RACE method. Sclerotinia-infected and oxox-induced cDNA libraries or 25 cDNAs made using a Marathon cDNA Amplification Kit (Clontech) were utilized as a source of templates for PCR amplification. To facilitate cloning full-length cDNAs from the initially cloned regions, we designed a pair of 28 bp vector primers flanking cDNAs on the both ends (3' and 5') of the pBS vector and directionally amplified either the 5' or 3' end of a cDNA with one of vector primers (pBS-upper or pBS-lower) and a gene-specific primer. Once the anticipated 5' end of a specific gene with an intact ATG start codon was cloned and sequenced, the full-length cDNA was amplified using a second gene-specific primer containing

corresponding to sequence upstream of the ATG and a vector primer at 3' end. The PCR products were cloned and sequenced by standard methods.

PCR reactions were performed in a total volume of 25 µl in 10 mM Tris-HCl, pH 8.3; 1.5 mM MgCl₂; 50 mM KCl; 0.1 mM dNTPs; 0.25 µM of each primer with 0.5 units of advantage cDNA polymerase mix (Clontech) or Pwo DNA polymerase (Boehringer). Genomic DNA and/or cDNA library mixtures were used as a source of templates for PCR amplification.

Isolation of pathogen-inducible promoters

Promoter regions of PR5, defensin, and BBE were isolated from sunflower genomic DNA using Universal GenomeWalker Kit (Clontech) according to the manufacturer's instructions. Restriction digested genomic DNAs were ligated with an adapter to construct pools of genomic DNA fragments for walking by PCR (Siebert et al. (1995) Nuc. Acids Res. 22:1087-1088).

15

20

25

30

10

Analysis of amplified PCR products

Amplified PCR fragments with the expected sizes were individually sliced out of a gel for a second round of PCR amplification with the same conditions as the initial PCR. Each second-round PCR product yielding a single band of the expected size was cloned into a TA vector (Clontech) according to the manufacturer's instructions. Identified positive clones were selected for DNA sequencing using an Applied BioSystems 373A (ABI) automated sequencer at the Nucleic Acid Analysis Facility of Pioneer Hi-Bred International, Incorporated. DNA sequence analysis was carried out with the Sequencer (3.0). Multiple-sequence alignments (Clustal W) of the DNA sequence were analyzed with the Curatool (CuraGen).

Construction of the Selerotinia-infected and resistance-enhanced (oxox-induced) sunflower cDNA libraries

Six-week-old SMF3 sunflower plants were infected with Sclerotinia sclerotrium by peticle inoculation with Sclerotinia-infested carrot plugs. Six days after infection, leaf and stem tissues were collected from infected plants for total RNA isolation. Total RNA was also isolated from sunflower oxox-transgenic

plants (line 610255) expressing a wheat oxalate oxidase gene at the six-week stage. Previous studies have shown that elevated levels of H₂O₂, SA, and PR1 protein were deducted in oxox-transgenic plants at six-week stage and the plants showed more resistance to Scierotinia infection (WO 99/04013). The mRNAs were isolated using an mRNA purification kit (BRL) according to manufacturer's instruction. cDNA libraries were constructed with the ZAP-cDNA synthesis kit into pBiuescrip pnagemid (Stratagene). A cDNA library mixture for PCR cloning was made of exact transgenic stem and Scierotinia-infected leaf libraries (1:2 mix).

10 Fungal infection and chemical treatments

Sumflower piants SMF3 were planted in 4-inch pots and grown in the greenhouse for four weeks. After transfer to the growth chamber, plants were maintained under 12 hour photoperiod at 22°C with a 80% relative humidity. Sixweek-old plants were inoculated with Scientinia-infested carrot plugs or sprayed with one of four different chemical treatments. For each plant, three petioles were inoculated and wrapped with 1x2 inch parafilm. Plant tissue samples were collected at different time points by immediately freezing in liquid nitrogen and then stored at -80°C.

20 Results

25

30

RNA profiling study of oxox-transgenic sunflower plants

Resistance to the fungal pathogen Sclerotinia is a trait of major importance for crops such as surflower, canola, and soybean. Sunflower Sclerotinia disease can be estab ished at various developmental stages with the main targets being head, stem, and root tissues. This suggests that resistance genes need to be constitutively expressed in multiple tissues. The major toxic and pathogenic factor produced by Sclerotinia is oxalic acid that can be converted into H₂O₂ and CO₂ by oxalate oxiduse. A candidate gene for detoxifying oxalate is the wheat oxalate oxiduse (oxar) which have been used to transform a sunflower inbred line.

Expression of oxox by a constitutive promoter significantly enhances resistance to Sclerotinia in surflower. In a growth chamber experiment, lesion size was six-fold lower in experiment sunflower plants upon infection with Sclerotinia mycelia relative to untrensformed plants. At the six-week-old stage, the oxox-transgenic

sunflower plants displayed a lesion mimic in the mature leaves. The enhanced Sclerotinia resistance of sunflower oxox transgenics is closely related to the observed elevated levels of SA and PR proteins (WO 99/04013).

In the RNA profiling analysis, 30 bands were induced and 30 bands were repressed in the oxox-transgenic stem and leaf tissues compared to non-transformed SMF3 plants. Three of the induced bands were sequenced (Table1), and the sequence information was used to clone the full-length clones.

Cloning of full-length cDNAs related to sunflower disease resistance

5

10

15

20

25

30

A PCR-based cloning method was developed to afficiently isolate fulllength cDNAs of the plant defense genes, from sunflower cDNA libraries (Figure 2). A cDNA library mixture containing both exex-transgenic cDNA library and Sclerotinia-infected cDNA library (1:2 mix) was used as template for PCR amplification. Using cDNA libraries as DNA template in PCR amplification had two benefits: (1) the number of unexpected PCR products was reduced as compared to genomic DNA as a source of template, and (2) disease-induced cDNA libraries increased the chance of isolating defense-related genes. To facilitate cloning fill-length cDNAs from the initial cloned regions, we designed a pair of 28 bp vector primers (Table 1) flanking cDNAs on the both ends (3' and 5') of the vector and directionally amplified either the 5' or 3' end of a cDNA with one vector primer and a gene-specific primer (Figure 1 and Table 1). The anticipated 5' end of specific gene with the intact ATG start codon was cloned and sequenced. The fulllength cDNA was amplified using a second gene-specific primer containing sequence upstream of the ATG and a vector primer at the 3' end. The PCR products were cloned and submitted to sequence analysis.

Table 1 provides RNA profiling band sequences (PBS) and oligonucleotide sequences used for PCR amplification of the cDNAs and promoter regions.

Oligonucleotide PES-upper (P3) and PBS-lower (P4) were two primers located at the ends of cDNA library vector, as indicated in Figure 2. For each targeted gene, two or three gene-specific primers were made to complete the 5'- end RACE (P1), the 3'- end PACE (P2), and the full-length RACE (P5). The additional antisense primers were made for cloning promoter regions of PR5, defensin, and BBE, using

the Genome Walker kit (Clontech) (Band h0a0-231.3, PR5; band d0l0-113.9, defensin: and m0s0-152.7, BBE).

* Oligonucleotide PBS-upper (P3) and PBS-lower (P4) were two primers located at the ends of cDNA library vector, as indicated in Figure 2. For each targeted gene, two or three gene specific primers were made to complete the 5' end RACE (P1), the 3' end RACE (P2), and the full-length RACE (P5). The additional antisense primers were made for cloning promoter regions of PR5-1 and BBE, 13.46 the genome walker kit from Cloatech. Band h0a0-231.3, PR5-1; band d010-113.9.

defensin; and w/s0-162.7, BBE

Cloning standawer PR5-1 cDNA and its promoter

isolated from sunflower. The nucleotide sequence of PR5-1 is set forth in SEQ ID:4 and the amino acid sequence encoded by this nucleotide sequence is set forth in SEQ ID:1. The sunflower PR5-1 protein with its amino-terminal signal sequence is 233 amino acids in length with a calculated molecular mass of 25 kDa and a pI of 6.71. Database searches with predicted amino acid sequence revealed significant sequence similarity with previously reported PR5 proteins from other plant species.

A full-length cDNA encoding pathogenesis-related protein-5 (PR5-1) was

The 5'-flunding sequence of the PR5-1 gene contains two potential pathogenresponsive MRE-like elements. These elements have the sequences TGTAGG
(nucleotides 23-28, SEQ ID:7) and AACAAAA (nucleotides 247-253, SEQ ID:7).
The PR5-1 promoter region also contains a CAAT box (nucleotides 438-441, SEQ ID:7) and a TATA box (nucleotides 485-490, SEQ ID:7). Figure 2 shows the
alignment of amino acid sequence of PR5-1 from sunflower with other PR5 or
osmotin-PR5 proteins from grape, soybean, tomato, and potato. Sunflower PR5-1
shows the Mahest sequence similarity to P21 protein (78% amino acid identity;

80% similarity) from soybean (Swiss-Prot P205096) followed by the osmotin-like protein from grape (Swiss-Prot O04708; 72% amino acid identity; 77% similarity), where sequence comparisons were performed with the GAP algorithm described above using default parameters.

5

25

30

Berberine Bridge Enzyme (BBE) cDNA and its promoter

A full-length cDNA encoding a BBE homologue was isolated from sunflower. The full-length cDNA set forth in SEQ ID:5 is 1809 nucleotides long with an open reading frame encoding a protein of 542 amino acids (SEQ ID:2) and 10 a calculated molecular mass at 61.41 kDa and a pI of 8.18 (Figure 5). The BBE promoter region contains a potential MR E-like element with the sequence TGTAGG (nucleotides 139-144, SEQ ID:8). The BBE promoter also contains a CAAT box (pucleotides 278-281, SEQ ID:8), and a TATA box (nucleotides 485-490, SEQ (D:8). The isolated cDNA shares homology with BBE cDNAs from 15 California poppy and opium poppy (Figure 3) and two published sunflower cDNA's encoding carbohydrate oxidases (WO 98/13478), which have antifungal activity, specifically against Phytophthera and Pythium species (Figure 3). The amino acid patience alignment indicates 42% identity and 52% similarity between the sunflower BBE and the previously parented sequences (Sunflower-15 and 20 Sunflower- 7 from WO 98/13478), where the comparison was performed with the GAP algorithm described above using the default parameters.

Inducible sunflower defensin cDNA and its promoter

The sunflower defensin cDNA is 556 nuclotides long with an open reading frame starting at nucleotide 36 and ending at nucleotide position 362 (SEQ ID:6). The deduced polypeptide is 108 amino acids long and contains a putative signal peptide at the amino-terminal end (SEQ ID:3). The cloned defensin promoter contains two W-boxes with the nucleotide sequence TTGACC (nucleotides 221-226, and nucleotides 1075-1080, SEQ ID:9), and a G-box with sequence CACGTG (nucleotides 554-569, SEQ ID:9). These cis-elements are potentially related to plant defense response. The defense promoter also contains a TATA box (nucleotides 357-350, SEQ ID:9). The protein has significant homology to other

reported plant defensins (Figure 4). Eight important cysteine residues in this novel defensin were highly conserved among all other known plant defensins.

Accumulation of PR5-1, defensin and BBE transcripts in response to fungal pathogen infection and chemical treatments

The expression of many of PR5 and defensin genes were induced by biotic and abiotic stresses (Terra et al. (1988) Planta 206:117-124); Ward et al. (1991) Plant Cell 3:1085-1094). Oxalic acid (OA) a compound produced by Sclerotinia and many other fungal pathogens in planta, plays an important role in the disease infection process (Noyes et al. (1981) Physiol. Plant Path. 18:123-132). Salicylic acid, jasmonic acid and H₂O₂ have been implicated as having a central role in plant disease resistance and systemic acquired resistance, and have been shown to induce the accumulation of many PR proteins including PR5 protein and defensin in Arabidopsis (Blechert et al. (1995) Proc. Natl. Acad. Sci. USA 92:4099-4105; Terra et al. (1988) Planta 206:117-124; Noyes et al. (1981) Physiol. Plant Path. 18:123-133)

10

15

20

Six-wee hold sunflower plants were either inoculated with Sclerotinia or treated with Efferent chemicals. Plants modulated with Sclerotinia showed wilt symptoms on modulated leaves 24 hours after inoculation and lesions started to spread to the main stem 3 days after infection. For the infection experiment, plant tissues were collected at 0, 6, 12, 24 hours, and 3, 6 and 10 days after infection. Chemical-treated plants were collected at 0, 6, 12, and 24 hours after foliar application.

Northern blot analysis revealed that sunflower PR5-1 protein was induced in leaf and stem tissues of the Sclerotinia-infected and oxox transgenic plants.

RNA profiling indicated that PR5-1 transcript level in the oxox transgenic plants was 9-fold higher than in the untransformed line (SMF3). Northern results indicated that the sunflower PR5-1 was up-regulated significantly by Jasmonic acid (45th M- and oxalic acid (5 mM). Up-regulation was less pronounced between control and salicylic acid, and H₂O₂ treated samples.

BBH transcripts were highly induced in exex-transgenic and *Sclerotinia* infected similar ver leaves. However, BBE transcripts were not detected in either control or links ad seem samples. Northern blot analysis confirmed the RNA

profiling result of increased BBE transcripts in oxox transgenic plants. The chemical insuction experiment revealed that BBE expression was induced by oxalic acid, H₂O₂, SA and JA at early time points and returned to the normal level within 24 hours after application.

The expression of the isolated sunflower defensin gene appeared to be different from other defensin genes. In general, plant defensin genes such as Arabidopsis PDF1.2 and radish defensin are induced by pathogens via an SA-independent and JA-dependent pathway. Northern results indicated that the sunflower defensin was up-regulated significantly by salicylic acid (5 mM), oxalic acid (5 mM) and H₂O₂ (5 mM). However, there was little difference between control and Jasmonio acid treated samples.

5

10

15

20

25

Defensin transcript levels were significantly higher in samples from oxox transgenic plants relative to levels in control plants. Northern analysis revealed that sunflower defensin was induced in leaf tissue of the Sclerotinia-infected and oxox transgenic plants. A time course study showed that defensin, PR5-1 and BBE transcripts were highly induced in oxox-transgenic tissues at the 6-week-old stage. These results indicate that the defense patrways were activated in oxox transgenic sunflowers at that stage.

All publications and patent applications mentioned in the specification are indicative of the level of those skilled in the art to which this invention pertains. All publications and patent applications are herein incorporated by reference to the same extent as if each individual publication or patent application was specifically and individually indicated to be incorporated by reference.

Although the foregoing invention has been described in some detail by way of illustration and example for purposes of clarity of understanding, it will be obvious that certain changes and modifications may be practiced within the scope of the appended claims.

THAT WHICH IS CLAIMED:

A method for increasing pathogen resistance in a plant, said method comprising transforming said plant with a DNA construct comprising a nucleotide sequence selected from the group consisting of:

5 a) sunflower PR5 homologue;

10

30

- b) a nucleotide sequence encoding the amino acid sequence of SEQ ID:1;
- c) the nucleotide sequence set forth in SEQ ID:4;
- d) a nucleotide sequence that shares at least 60% identity to the sequence of SEQ ID:4;
 - e) a nucleotide sequence deposited as Patent Deposit No. PTA-67;
 - f) a sunflower defensin homologue;
 - g) a nucleotide sequence encoding the amino acid sequence of SEQ ID:3;
- 15 h: the nucleotide sequence set forth in SEQ ID: 6;
 - a nucleotide sequence that shares at least 60% identity to the semence of SEQ ID:5:
 - a nucleotide sequence deposited as Patent Deposit No. PTA-75;
 - k) a sunflower BBE homologue;
- 20 a nucleotide sequence encoding the amino acid sequence of SEQ 1D:2:
 - rt) the nucleotide sequence set forth in SEQ ID:5;
 - a nucleotide sequence that shares at least 60% identity to the sequence of SEQ fold.
- 25 c) a nucleotide sequence deposited as Patent Deposit No. PTA-73;
 - p) a nucleotide sequence that hybridizes to the sequence of any one of a)-o) under stringent conditions;

wherein said nucleotide sequence is operably linked to a promoter that drives expression of a coding sequence in a plant cell and regenerating stably transformed plants.

2. The method of claim 1, wherein said stringent conditions comprise hybridization in 50% formamide, 1M NaC!, 1% sodium dodecyl sulphate at 37° C, and a wash in 15 mM NaC!, 1.5 mM trisodium citrate at 60°C.

- 5 3. The method of claim 1, wherein said pathogen is a fungal pathogen.
 - 4. The method of claim 1, wherein said plant is a dicot.
 - 5. The method of claim 1, wherein said plant is a monocot.

10

30

- 6. The method of claim 1, wherein said promoter is a constitutive promoter.
- 7. The method of claim 6, wherein said constitutive promoter is selected from the scp1 or ucp promoter.
 - 8. The method of claim 1, wherein said promoter is an inducible promoter.
- 20 9. The method of claim 8, wherein said promoter is a pathogen-inducible promoter.
 - 10. A plant having stably incorporated into its genome a DNA construct comprising a nucleotide sequence selected from the group consisting of:
- a) a sunflower PR5 homologue;
 - a nucleotide sequence encoding the amino acid sequence of SEQ ID:1;
 - c) the nucleotide sequence set forth in SEQ ID:4;
 - a nucleotide sequence that shares at least 60% identity to the sequence of SEQ ID:4;
 - e) a nucleotide sequence deposited as Patent Deposit No. PTA-67;
 - f) a sunflower defensin homologue;

g) a nucleotide sequence encoding the amino acid sequence of SEQ ID:3:

- h) the nucleotide sequence set forth in SEQ ID:6;
- i) a nucleotide sequence that shares at least 60% identity to the sequence of SEQ ID:6;
 - j) a nucleotide sequence deposited as Patent Deposit No. PTA-75;
 - k) a sunflower BBE homologue;

5

15

- a nucleotide sequence encoding the amino acid sequence of SEQ ID:2;
- m) the nucleotide sequence set forth in SEQ ID:5;
 - n) a nucleotide sequence that shares at least 60% identity to the sequence of SEQ ID:5;
 - o) a nucleotide sequence deposited as Patent Deposit No. PTA-73;
 - p) a nucleotide sequence that hybridizes to the sequence of any one of a) o) under stringent conditions;

wherein said nucleotide sequence is operably linked to a promoter that drives expression of a coding sequence in a plant cell.

- The plant of claim 10, wherein said stringent conditions comprise
 hybridization in 50% formamide, 1M NaCl. 1% sodium dodecyl sulphate at 37° C,
 and a wash in 15 mM NaCl, 1.5 mM trisodium citrate at 60°C.
 - 12. Seed of the plant according to claim 10.
- 25 13. A plant cell having stably incorporated into its genome a DNA construct comprising a nucleotide sequence selected from the group consisting of:
 - a) a sunflower PR5 homologue;
 - b) a nucleotide sequence encoding the amino acid sequence of SEQ ID:1:
- 30 c) the nucleotide sequence set forth in SEQ ID:4:
 - d) a nucleotide sequence that shares at least 60% identity to the sequence of SEQ ID:4;
 - e) a nucleotide sequence deposited as Patent Deposit No. PTA-67;

	f)	a suntiower defensin nomologue;
	g)	a nucleotide sequence encoding the amino acid sequence of SEQ
		īD:3;
	h)	the nucleotide sequence set forth in SEQ ID:6;
5	i)	a nucleotide sequence that shares at least 60% identity to the
		sequence of SEQ ID:6;
	j)	a nucleotide sequence deposited as Patent Deposit No. PTA-75;
	(k)	j a siccilower BBE himplogue;
	1)	a nucleotide sequence encoding the amino acid sequence of SEQ
10		ID:2;
	m)	the nucleotide sequence set forth in SEQ ID:5;
	n)	a nucleotide sequence that shares at least 60% identity to the
		sequence of SEQ ID:5;
	0)	a nucleotide sequence deposited as Patent Deposit No. PTA-73;
15	p)	a nucleotide sequence that hybridizes to the sequence of any one of
		al-o) under stringent conditions;
	wherein said	nrelectade sequence is operably linked to a promoter that drives
	expression of	e coding sequence in a plant cell.
20	14.	The plant cell of claim 13, wherein said stringent conditions
	comprise hyb	ridization in 50% formamide, IM NaCl, 1% sodium dodecyl sulphate
	at 37° C, and	a wash in 15 mM NaCl, 1.5 mM trisodium citrate at 60°C.
	15.	An isolated nucleic acid molecule having a nucleotide sequence
25		the group consisting of:
	a)	a sunflower PR5 homologue;
	5)	a nucleotide sequence encoding the amino acid sequence of SEQ

a nucleotide sequence that shares at least 60% identity to the

a nucleotide sequence deposited as Patent Deposit No. PTA-67;

the nuclectide sequence set forth in SEQ ID:4;

ID:1:

sequence of SEQ 1D:4:

a sunflower defensin homologue;

c)

d)

e)

30

g) a nucleotide sequence encoding the amino acid sequence of SEQ II:3;

- h) the nucleotide sequence set forth in SEQ ID:6;
- i) a nucleotide sequence that shares at least 60% identity to the sequence of SEQ ID:6;
 - j) a nucleotide sequence deposited as Patent Deposit No. PTA-75;
 - k) a sunflower BBE homologue;
 - a nucleotide sequence encoding the amino acid sequence of SEQID:2:
- m) the nucleotide sequence set forth in SEQ ID:5;
 - n) a nucleotide sequence that shares at least 60% identity to the sequence of SEQ ID:5;
 - o) a nucleotide sequence deposited as Patent Deposit No. PTA-73;
- p) a nucleotide sequence that hybridizes to the sequence of any one of a)-6) under stringent conditions.
- 16. The nucleic acid molecule of claim 15, wherein said stringent conditions comprise hybridization in 50% formamide, 1M NaCl, 1% sodium dodecyl sulphate at 37° C, and a wash in 15 mM NaCl, 1.5 mM trisodium citrate at
 20 60°C.
 - 17. A DMA construct comprising a nucleotide sequence of claim 15.
 - 18. A vector comprising a nucleotide sequence of claim 17.

25

5

- 19. A substantially purified protein molecule having an amino acid sequence selected from the group consisting of:
 - a) a sunflower PR5;
 - b) the amino acid sequence set forth in SEQ ID:1;
- 30 c) an amino acid sequence that shares at least 60% sequence similarity to the sequence of SEQ ID:1;
 - d) an amino acid sequence encoded by the nucleotide sequence deposited as Patent Deposit No. PTA-67;

	e)	a sunflower defensin;
	f)	the amino acid sequence set forth in SEQ ID:3;
	g)	an amino acid sequence that shares at least 60% sequence similarity
		to the sequence of SEQ ID:3;
5	h)	an amino acid sequence encoded by the nucleotide sequence
		deposited as Patent Deposit No. PTA-75;
	i)	a sunflower BBE;
	j)	the amino acid sequence set forth in SEQ ID:2;
	k)	an amino acid sequence that shares at least 60% sequence similarity
10		to the sequence of SEQ ID:2;
	1)	an unino acid sequence encoded by the nucleotide sequence
		deposited as Patent Deposit No. PTA-73.
	20.	A promoter capable of driving expression in a plant cell said
15	promoter sele	ected from the group consisting of:
	a)	ε promoter that drives expression of a sunflower PR5 gene in its
		native state;
	$b\rangle$	e promoter whose sequence is immediately 5' to the sequence set
		forth in SEQ ID:4 in its native state;
20	c)	a promoter having the sequence set forth in SEQ ID:7;
	đ)	a promoter that drives expression of a sunflower defensin gene in its
		native state;
	e)	a promoter having the sequence set forth in SEQ ID:9;
	f)	a promoter whose sequence is immediately 5' to the sequence set
25		forth in SEQ ID:6 in its native state;
	g)	a promoter having the nucleotide sequence deposited as Patent

- g) a promoter having the nucleotide sequence deposited as Pater Deposit No. PTA-560;
- h) a promoter that drives expression of a sunflower BBE;
- i) a promoter whose sequence is immediately 5' to the sequence set touch in SEQ ID:5 in its native state; and
 - j) a promoter having the sequence set forth in SEQ ID:8.

30

21. A DNA construct comprising a promoter of claim 20.

- 22. A vector comprising a nucleotide sequence of claim 20.
- 23. A plant comprising a nucleotide sequence of claim 20 stably5 incorporated in its genome.
 - 24. A plant cell comprising a nucleotide sequence of claim 20 stably incorporated in its genome.
- 10 25. A composition comprising a protein of claim 19, and a carrier.
 - 26. The composition of claim 25, wherein said carrier is selected from a surface active agent, an inert carrier, an encapsulating agent and an agrochemical pharmaceutical carrier.

15

- 27. The composition of claim 25, wherein said carrier is a pharmaceutical carrier.
- 28. A method for confrolling a plant pathogen comprising applying an
 anti-pathogenic amount of the protein of claim 19 to the environment of said pathogen.
 - 29. The method of claim 28 wherein said protein is applied to a plant.
- 25 30. The method of claim 28 wherein said protein is applied by a procedure selected from the group consisting of spraying, dusting, scattering and seed coating.
- 31. A method for controlling a plant pathogen comprising applying an
 30 anti-pathogenic amount of the composition of claim 25 to the environment of said pathogen.

(54) Title: SUNFLOWER ANTI-PATHOGENIC PROTEINS AND GENES AND THEIR USES

(57) Abstract: Compositions and methods to aid in protecting plants from invading pathogenic organisms are provided. The compositions of the invention comprise anti-pathogenic genes, including 5' regulatory sequences in the promoter, and proteins encoded by the anti-pathogenic genes. The compositions find use in methods for reducing or eliminating damage to plants caused by plant pathogens. Transformed plants plant cells, tissues, and seed having enhanced disease resistance are also provided.

rnational application No. PCT/US 00/17090

Box I Observations where delitate aims were found unsearchable (Continuation of item 1 of first sheet)
This International Search Researchs to be an established in respect of certain claims under Article 17(2)(a) for the following reasons:
1. Claims Nos.: because they relate the coject mainer not required to the searched by this Authority, namely:
2. Claims Nos. because the / sela e i a is to the international Apprace for that do not comply with the prescribed requirements to such an extent that of the international Cearon can be carried out, specifically:
3. Claims Nos.: because they are department dams and are not drafted in accordance with the second and third sentences of Rule 6.4(a).
Box II Observation: Altreatary or revention is lasteng (Continuation of item 2 of first sheet)
This international Series $\log K$, the hydroconditional invartions of this international application, as follows:
see additiculi shaai
1. X As all required additionable associations are seen and the search able plaints.
2. As all searchefris that the region of assembled without of face that fifted an additional fee, this Authority did not invite payment of any additional fee.
3. As only some of the rames ad additional search fees were timely paid by the applicant, this International Search Report covers only those diagram or which fees were paid, specifically claims Nos.:
4. No required addadone sees on these sere time would by the applicant. Consequently, this International Search Report is restricted to the adda of the first of the chair to the country of times Nos.:
Remark on Protest The additional search fees were accompanied by the applicant's protest. X to protest accompanied the payment of additional search fees.

FURTHER INFORMATION COMMINUED FROM PCT/ISA/ 210

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

1. Claims: 1-31 all partially

Tschated nucleic acid molecule and protein representing summare. FR5 as defined by SEQ ID NOS 1,4, and 7, method for anchessing pathogen resistance using said sequences, plants and plant cells incorporating said sequences, promoter represented by said sequence, and prodein compositions and their use in pathogen control based on Aulo dequences.

2. Claims: 1-31 all partially

Isolated nucleic acid molecule and protein representing such are defensin as defined by SEQ ID NOS 3,6, and 9, mails of the increasing pathogen resistance using said sequences, lands and clarificalls incorporating said sequences, promoter represented by said sequence, and protein respections and their use in pathogen control based of the respect.

3. Claims: 1-2' and perhially

Isolated runleic acid molecule and protein representing summit wern RBE as defined by SEQ ID NOS 2,5, and 8, method for moreasing pathogen resistance using said securices plants and plant colls incorporating said sequence, and protein compositions and their use in pathogen control based on said sequences.
